| (54) Title: HIGH AFFINITY TAMOXIFEN DERIVATIVES AND USES THEREOF | | | |
| (57) Abstract | | | |
| <p>Applicants describe the synthesis of tamoxifen derivatives, most particularly halo, halo alkyl and hydroxy tamoxifen derivatives, wherein with the native tamoxifen molecule includes a substituted chemical group positioned on the aliphatic chain of the tamoxifen molecule. Particular halogenated tamoxifen derivatives of the invention include chloro, bromo, iodo and fluoro tamoxifen derivatives, and corresponding lower alkyl halogenated forms. The halogenated tamoxifen derivatives possess superior binding affinities for estrogen receptor rich tissues, such as uterine tissue and breast tissue, relative to unsubstituted native tamoxifen. In particular, the fluoro and bromo tamoxifen derivatives have potential use in imaging estrogen receptors by PET whereas the iodinated tamoxifens have potential use in imaging estrogen receptors by SPECT. The bromomethyl tamoxifen derivatives are demonstrated to bind estrogen receptors with the greatest enhancement of binding affinity over native tamoxifen. Rapid and efficient methods of preparing the tamoxifen derivatives having high specific activity ($> 6 \text{ Ci}/\mu\text{mol}$) are also disclosed. Aliphatic chain substituted tamoxifen derivatives are shown to possess greater estrogen receptor binding affinity and more potent tumor cell inhibition than tamoxifen or tamoxifen derivatives substituted at other locations on the molecule (i.e., non-aliphatic chain substituted tamoxifen). The tamoxifen derivatives of the present invention may advantageously be used as anticancer therapeutic agents to halt estrogen-receptor positive tumors, such as those of breast and uterine tissue.</p> | | | |

HIGH AFFINITY TAMOXIFEN DERIVATIVES
AND USES THEREOF

The present invention relates to the field of tamoxifen derivatives and analogs, particularly halogenated tamoxifen derivatives and analogs. In that novel tamoxifen derivatives are described wherein the
5 aliphatic chain of the molecule is substituted with a halogen group, the present invention also relates to methods of synthesizing tamoxifen analogs and derivatives.

10 In that the described tamoxifen derivatives have high affinity for binding estrogen receptors and may be labeled with detectable "tagging" molecules, rendering labeled estrogen receptors highly visible through
15 positron emission topography (PET) and single photon emission computed tomography (SPECT), the present invention also relates to reagents, radiopharmaceuticals and techniques in the field of molecular imaging.

The halogenated tamoxifen derivatives of the present
20 invention are advantageously used in the imaging of estrogen receptors, for example, in breast, ovarian, uterine and brain tissue and may therefore be useful in the diagnosis of estrogen-receptor positive cancers.

25 The present invention also relates to the field of anti-cancer therapeutic agents, particularly to methods of breast tumor therapy, in that the described high affinity of these halogenated (i.e., iodo-, fluoro-, bromo- and chloro-) tamoxifen derivatives for estrogen
30 receptors may be advantageously used to treat estrogen-receptor positive tumors.

Endocrine therapy provides an important nonsurgical method for treatment for breast carcinoma. This type of therapy is still considered standard for certain subsets of patients, typically postmenopausal women whose primary
5 tumors have high estrogen levels.¹⁻³ The synthesis of F-18 fluoroestradiol for application in diagnosing breast tumors in humans has recently been described.⁴ Observation of significant changes in the binding of estrogen receptors in breast tumors were reported using
10 PET. However, technical difficulties associated with estrogen receptor saturation in patients receiving tamoxifen, or other estrogen receptor antagonist, has been observed to decrease the sensitivity and accuracy of using an estrogen-based receptor tag in diagnosing and
15 monitoring the progress of tumors in patients receiving such treatments.

Tamoxifen (I), a potent non-steroidal antiestrogen, has been widely used in the treatment of human breast
20 tumors. Tamoxifen has few side effects when compared with other hormonal treatments. Tamoxifen is cytostatic (i.e, it prevents/inhibits cell growth), and exerts competitive inhibitory activity at the receptor level with estrogen. More specifically, the cytostatic
25 activity of tamoxifen results from its ability to bind to cytoplasmic estrogen receptors and be translocated to cell nuclei, where cell proliferation is prevented.¹⁻³ Thus, tamoxifen is often administered as an anticancer agent.⁶ For example, Foster et al.⁶ describes the effect
30 of various tamoxifen hydroxy-derivatives on the growth of MCF-7 breast cancer cell line in its native form. However, highly active *in vitro* hydroxy tamoxifen derivatives were found to be less active than tamoxifen *in vivo* against a DMBA-induced ER-positive tumor in rats
35 and only slightly more active against a hormone dependent mammary tumor in mice.

Tamoxifen has a relatively low binding affinity for the estrogen receptor (ER). Attempts have therefore been made to synthesize tamoxifen derivatives having improved ER binding affinity and specificity to enhance its action as an anti-cancer therapeutic agent. The structure of tamoxifen is demonstrated as:

[Formula 1]

A variety of modified tamoxifen derivatives have been described in the literature. Structural modifications have been made at virtually every site on the three aromatic rings of the tamoxifen molecule. For example, a 4-hydroxytamoxifen derivative in which X = -OH has been developed having the structure shown below ³³:

[Formula 2]

However, while the 4-hydroxytamoxifen derivative was shown to be a potent anti-estrogen in vitro, it proved to be less effective than tamoxifen in vivo, owing to rapid glucuronidation of the hydroxyl group, followed by excretion. 4-Hydroxytamoxifen is the active intracellular form of the tamoxifen molecule in vivo, due to cytoplasmic hydroxylation after tamoxifen enters the cell. However, when 4-hydroxytamoxifen is administered

in vivo, its polarity reduces its ability to cross the cell membrane, thereby reducing its access to estrogen receptors located in the cytoplasm. Therefore, in vivo tests indicate 4-hydroxytamoxifen to be less active than the native tamoxifen.²³

Other tamoxifen derivatives having a 4-position substitution of the phenyl ring, in which X is methoxy, methyl, fluoro or chloro, have also been proposed and evaluated.¹⁵ K. E. Allen et al. (1980) conducted studies wherein the 4-methyl, 4-chloro and 4-fluoro derivatives were evaluated and found to have approximately equal activity for estrogen receptor binding affinity compared to tamoxifen in vitro. However, uterine weight tests indicated that these phenyl group derivatives had lower anti-estrogenic activity than tamoxifen, while other tests indicated that the activity of the 4-methoxy phenyl derivative was about the same as native tamoxifen.

A 4-iodo substitution of the phenyl ring as a tamoxifen derivative (formula 2: X = iodo) has recently been found to have greater potency than tamoxifen in relation to detecting estrogen receptor-positive breast cancer.¹³ Other 3-iodo, 4-iodo, 3-bromo and 4-bromo phenyl ring-substituted tamoxifen derivatives have also been described.¹³ For example, the McCague et al. patent (U.S. 4,839,155) described the preparation of an iodo or bromo halogenated tamoxifen. However, the halogen, I or Br, was again substituted at one of the phenyl rings of the tamoxifen structure.

Derivatives of tamoxifen wherein other than the phenyl groups of the molecule are substituted have not been proposed in the art. Such a molecule would be desirable, as it would leave the major portion of the molecule unchanged and free to bind with the "target"

- molecule or tissue cells. Additionally, to further enhance tissue targeting specificity, a non-phenyl ring halogenated tamoxifen derivative would preferably be coupled with a "targeting" molecule, such as a
5. microparticle.

Non-phenyl ring halogenated tamoxifen derivatives with enhanced binding affinity, greater specific radioactivity, and which can readily traverse the cell membrane have not as yet been developed in the art. The development of such derivatives would represent a tremendous improvement in the quality of imaging techniques currently available, as well as improve the accuracy of PET and SPECT scans.

15 Other alternative compounds proposed as possible radiopharmaceuticals useful in the imaging of tissue receptors include labeled progesterone and estrogen derivatives. For example, Pomper et al. described a ligand for the progesterone receptor.¹⁶ The aliphatic fluorination of FENP (21-[¹⁸F]fluoro-16- α -ethyl-19-norprogesterone) is described as demonstrating a high specific uterine target tissue uptake.¹⁶ This ligand for the progesterone receptor was labeled with the positron-emitting radionucleotide fluorine-18 ($t_{1/2} = 110$ min).

Estrogen-based imaging agents described in the literature include radionuclides of iodine²⁰, fluorine¹⁹, and bromine²¹. By way of example, an estrogen-based imaging agent described in the literature is the 16- α -[¹⁸F]fluoro-17- β -estradiol ligand.¹⁷

The preparation of 16- α -[¹⁸F]fluoroestrogens and their selective uptake by estrogen target tissues in rats has been described by Kieseewetter et al.¹⁹.

35 Significant changes in the binding of estrogen receptors

in breast tumor were reported with the use of [^{18}F]fluoroestradiol using PET.⁴ However, the radioisotope ^{18}F has a very short half life, and therefore techniques and molecules which employ this radioisotope must be rapid, and preferably more rapid than currently employed molecular labeling techniques allow.

Unfortunately, estrogen-based imaging agents are of limited utility in patients receiving estrogen based therapies due to the competition between imaging agents and therapeutic agents for estrogen receptors. Thus, a poor correlation is likely to exist between the actual physiological response within the tumor during hormonal therapy versus the response which is shown by an estrogen-based imaging agent. For these reasons, a progestin-based imaging agent for breast tumors might be preferred over an estrogen-based agent because tumor response to hormonal therapy appears to correlate better with progesterone receptor positivity than with estrogen receptor positivity.¹⁷ It has further been reported that estrogen receptor positive tumors in patients on hormonal therapy (e.g. tamoxifen) could not be imaged with an estrogen, as the circulating levels of tamoxifen and its metabolites are sufficiently high to fully occupy the estrogen receptor¹⁸, making visualization quite difficult.

While the radiolabeled tamoxifen derivatives described in the literature have demonstrated some increase in estrogen receptor binding affinity, they do not demonstrate sufficient specific radioactivity due to the low tamoxifen phenolic ring incorporation of the radioactive halogen atoms. Thus, the derivatives' enhanced affinity for estrogen receptor is offset by a reduction in the radioactivity incorporated.

Moreover, the fluorine ion radioisotope, ^{18}F , with its reportedly low effective dose equivalency and a short half-life ($t_{1/2} = 110$ min) further exacerbates the problem of obtaining sufficiently labeled reagent, which is
5 stable over an experimentally useful period of time.

For these reasons, any method which would utilize ^{18}F in labeling the phenyl rings of tamoxifen molecule must be rapid (i.e. within a 2 hour reaction time) to avoid a
10 loss in specific activity of the label.

Currently used tamoxifen derivatives, substituted at the various phenolic sites of the tamoxifen structure, can potentially block the formation of the active
15 metabolite, 4-hydroxytamoxifen. Such a blockage may result in a decrease in receptor binding affinity of the particular tamoxifen analog since the 4-hydroxylated derivative is known to possess higher affinity. Alternatively, a competitive elimination reaction of 4-
20 position substituted analogs may occur in the cytosol through the formation of the active metabolite, 4-hydroxytamoxifen. Such elimination processes are known to sometimes occur after drugs cross cell membranes.

25 Tamoxifen derivatives which could be more rapidly synthesized, with higher specific radioactivity and/or with improved receptor binding affinity or specificity, would offer a significant advance to the art, especially with regard to the *in vivo* diagnosis and therapy of
30 estrogen positive tumors and the imaging of estrogen receptors in patients on a hormone-based regimen.

The present invention provides novel halogenated tamoxifen analogs found to have surprisingly and
35 unexpectedly enhanced binding affinity for estrogen receptors. The particular chemistry of the claimed

tamoxifen analogs and derivatives advantageously provides a rapid and simple method for preparing and labeling the tamoxifen molecule at a non-aromatic carbon of tamoxifen, particularly at the aliphatic (alkyl) chain of the native
5 tamoxifen structure demonstrated at Formula 1.

The claimed no-carrier added, aliphatic chain substituted and radiolabeled tamoxifen derivatives are unlike any other labeled tamoxifen derivative described
10 in the literature¹³, and possess an enhanced binding affinity for estrogen receptors while retaining high specific radioactivity. Due to this enhanced binding affinity for estrogen receptors, the described tamoxifen derivatives and analogs can be advantageously employed to
15 treat, diagnose and/or monitor estrogen receptor-positive tumors (e.g., hormone dependent cancers). Additionally, the derivatives may also be advantageously used to predict the efficiency of tamoxifen-related therapy of breast tumors.

20 The term "aliphatic chain" substituted tamoxifen derivative as used in describing the claimed halogen substituted forms of the native tamoxifen molecule refers to chemically substituted forms of the tamoxifen molecule
25 wherein a halogen, haloalkyl or hydroxy group is positioned at other than one of the three phenyl rings of the native tamoxifen structure, and at other than the double carbon bond of the native tamoxifen chemical structure (See Formula 1). Even more particularly, the
30 tamoxifen derivatives of the present invention are defined as including a halogen, haloalkyl or hydroxy group at the end of the aliphatic carbon chain which is pendant to one of the carbons which comprises the double carbon-carbon bond of the native tamoxifen structure.

35

Any of the family of halogen atoms may be used in conjunction with the claimed invention. By way of example, the halogen atoms include fluorine, bromine, iodine, chlorine and astatine. Those particular halogens
5 most preferred in the present invention include fluorine, bromine, iodine and chlorine.

Applicants' halo-alkyl, halogen and hydroxy substituted tamoxifen derivatives include the halogen
10 atom or hydroxy moiety strategically placed on the aliphatic chain of the tamoxifen molecule. Thus modified, the molecule has greater estrogen receptor binding affinity than native tamoxifen. Additionally, the placement of a halogen atom at the aliphatic side
15 chain, rather than on the aromatic portions of the tamoxifen structure, preserves the major portion of the tamoxifen molecule for binding with estrogen receptors and/or other molecules. Moreover, labeling of the tamoxifen structure at the alkyl site rather than at any
20 of the structures phenolic rings, requires only minimal alteration of the tamoxifen structure. Limited modification of the tamoxifen structure is desirable because phenyl rings and phenoxyethylamine chains are essential for retaining the structure necessary to assure
25 proper conformational fit with estrogen receptors and to facilitate successful entry of the molecule through the cell membrane and into the cytoplasm for *in vivo* use. As used in the present invention, the term "native" tamoxifen refers to that structure of tamoxifen which is
30 unsubstituted and which corresponds to the chemical structure presented at Formula 1.

The substitution of the N,N-dimethyl group of tamoxifen with an N,N-diethyl group is demonstrated by
35 applicants to increase estrogen receptor binding with the halogen tamoxifen analog up to 30-fold. The binding

affinity of the described halogenated tamoxifen derivatives to estrogen receptors is increased in all cases by at least 4-fold as compared to native tamoxifen.

5 Radiolabeling of the halogen tamoxifen derivative with [^{18}F], [^{131}I], [^{123}I], [^{77}Br] for Spect, or [^{75}Br] for PET provides a molecule with both high specific radioactivity and high estrogen receptor binding affinity. Radiolabeled forms of the halogen chloride
10 [Cl] may also be employed. In order to account for the short half life of the particular radioisotopes used, the Inventors have optimized the synthesis of these halogenated tamoxifen derivatives to provide relatively high specific radioactivity. These halogenated
15 derivatives are also shown to have high binding affinity for estrogen receptors. The optimization of isotope half life, high estrogen receptor affinity and target cell specificity provides particular advantages for the in vivo imaging of estrogen receptors.

20

The distinguishing structural features of the claimed aliphatic chain substituted tamoxifen derivatives establish in part the superiority of the claimed analogs over the N,N-dimethyl (phenyl ring substituted) tamoxifen
25 derivatives described by Foster et al. and others.⁶ The claimed tamoxifen analogs and derivatives also feature the specific substitution of tamoxifen with a fluorine, iodine, chlorine or bromine halogen atom or lower halo-alkyl group at the aliphatic chain of the tamoxifen
30 molecule, in contrast to the phenyl-ring substituted tamoxifen structure described in Foster et al.⁶ The synthesis and chemical structure of the claimed halogenated and halo-alkyl tamoxifen analogs are distinct from all derivatives discussed in the literature,

-11-

including the phenolic ring-substituted tamoxifen derivative described by McCague in U.S. Patent No. 4,839,155.

- 5 Most generally, the tamoxifen derivatives of the claimed invention comprise the following structure:

- 15 wherein R₁ is a halogen or lower halo-alkyl; chloromethyl, bromomethyl-hydroxy, hydroxymethyl, tosyl or tosylmethyl; R₂ is a lower alkyl; R₃ is a lower alkyl, and wherein R₂ is not methyl when R₃ is methyl. In a most preferred embodiment of the described tamoxifen derivatives, R₂ and R₃ are most particularly defined as ethyl. In still another embodiment, R₂ is methyl and R₃ is ethyl. In particular embodiments of the invention, R₁ is fluoromethyl and R₂ and R₃ are ethyl. In still another embodiment, R₁ is iodomethyl and R₂ and R₃ are ethyl.
- 20
- 25

A lower halo-alkyl as defined for purposes of the present invention is a carbon chain of less than 5 carbons with a halogen atom attached thereto. A lower alkyl is defined as a carbon chain of less than 5 carbon atoms such as methyl (1-C), ethyl (2-C), propyl (3-C), butyl (4-C) or pentyl (5-C). Most preferably R₂ is methyl or ethyl. Similarly, R₃ is most preferably methyl or ethyl. However, R₂ is not methyl when R₃ is methyl.

30

35

-12-

In a particularly preferred embodiment of the tamoxifen derivatives described herein, R_1 is a halogen further defined as bromine, chlorine, fluorine or iodine. Where R_1 is a lower halo-alkyl, the lower halo-alkyl by way of example is defined as bromomethyl, fluoromethyl, iodomethyl or chloromethyl. In still a further embodiment of the described tamoxifen derivative, R_1 is a lower hydroxy alkyl, such as, for example, hydroxymethyl.

In a second most particularly preferred embodiment, the tamoxifen derivatives included within the scope of the invention are radiolabeled, and comprise:

wherein X is ^{18}F , ^{131}I , [^{18}F]fluoromethyl, [^{131}I]iodomethyl, chloromethyl, or bromomethyl; R_2 is methyl or ethyl, and wherein R_3 is methyl or ethyl. Most preferably, R_2 is not methyl when R_3 is methyl. In a particularly preferred embodiment of this particular tamoxifen derivative, X is [^{18}F]fluoromethyl, R_2 is ethyl, and R_3 is ethyl. The three phenyl rings of the tamoxifen structure are unsubstituted phenyl rings. In still another particularly preferred embodiment, X is [^{131}I]iodomethyl, R_2 is ethyl and R_3 is ethyl.

In still another most preferred embodiment of the claimed tamoxifen derivative, R_1 is chloromethyl or chloro, R_2 is ethyl and R_3 is ethyl. Where bromine is the

halogen, R₁ is bromomethyl or bromo, R₂ is ethyl and R₃ is ethyl.

The fluoromethyl tamoxifen derivatives herein
5 disclosed demonstrate an enhanced binding affinity for
estrogen receptors compared to other tamoxifen
derivatives having a a 30-fold (*trans*) and 6-fold (*cis*)
enhanced estrogen receptor binding affinity. For iodo-
methyl tamoxifen analogs, the *trans* isomer has a 15-fold
10 and the *cis*-isomer has a 10-fold enhanced estrogen
receptor binding affinity, compared to other tamoxifen
derivatives described in the literature. Salituro et al.
reported that the *cis* isomer of tamoxifen azizidine has
50-fold less affinity than the *trans* isomer. Placing a
15 fluorine atom at the 4-position of phenyl ring has been
demonstrated to decrease binding affinity 40-fold when
compared to native tamoxifen. Pomper et al describes
progesterone analogs only, which have affinity for
progesterone receptors. Thus, that data is not directly
20 compared here. (Shani et al.)³⁸

The bromomethyl tamoxifen analogs provide for the
trans isomer a 50-fold enhancement of estrogen receptor
binding affinity, and for the *cis* isomer, a 38-fold
25 enhancement of estrogen receptor binding affinity.
Particular other of the tamoxifen derivatives exhibit at
least a 4-fold increase in estrogen receptor binding
affinity compared to native tamoxifen.

30 Because of the enhanced estrogen receptor binding
affinity demonstrated by the described tamoxifen
derivatives and analogues, Applicants provide an
efficient and specific reagent which is useful in the
imaging of estrogen receptors. In such an embodiment,
35 the tamoxifen derivative includes a radiolabel "tag",
most preferably an ¹⁸F, ¹³¹I, ¹²³I or ⁷⁵Br (for positron)

and ^{77}Br atom (for SPECT). In a most particularly preferred embodiment of the imaging reagent, the "tag" is an ^{18}F , ^{131}I , or ^{77}Br radionucleotide located at the alkyl side chain of the halogen-substituted tamoxifen molecule.

5

Most preferably, the alkyl side chain (for R_2 and R_3) comprises a carbon chain of at least two carbons (ethyl). Methods of performing the described radiosynthesis of the disclosed [^{18}F]fluoromethyl, [^{131}I]iodomethyl, ^{77}Br bromomethyl tamoxifen derivatives are also provided
10 herein. The radiosynthesis of ^{77}Br -labeled tamoxifen is similar to the ^{131}I -labeled analog. Therefore, the methods described herein for the preparation of radiolabeled fluoro and iodo tamoxifen derivatives may be
15 utilized for the preparation of radiolabeled forms of the bromo and chloro derivatives, by using an analogous bromo- or chloro-salt as the starting reagent.

In that the halogenated derivatives of tamoxifen
20 disclosed herein have enhanced estrogen receptor binding affinity, the presently disclosed tamoxifen derivatives provide an improved method by which estrogen receptors may be imaged through a PET or a SPECT radioimaging protocol. Most particularly, the halogen to be used in
25 forming these estrogen binding agents is fluorine, bromine, or iodine.

Additionally, in order to even further enhance the tissue- targeting of the halogen tamoxifen derivatives to
30 those tissues rich in estrogen receptors, the Inventors propose to couple the described radiolabeled, substituted tamoxifen derivatives to microparticles. This coupling can be accomplished by reacting the halogenated tamoxifen with a polymer in the presence of a coupling reagent
35 (e.g., dicyclohexylcarbodiimide) (See Figure 4). The coupling of the tamoxifen derivative with the

microparticle is expected to enhance the molecule targeting to particular tissues. The "payload" (e.g., a chemotherapeutic halogenated tamoxifen derivative) can then be released from microparticles by a diffusion or erosion process and used to kill tumors.

To test this approach, estrone (estrogen agonist) was conjugated to poly(benzyl)glutamate (PBLG). After conjugation, the estrogen receptor binding was determined. The IC_{50} for estrone was $5 \times 10^{-8} M$, whereas the conjugated analog was $5 \times 10^{-7} M$. The conjugation yield was 86% (determined from UV at 282 nm). PBLG polymer loaded with cisplatin (an antitumor agent) showed sustained release properties (particle size $100 \mu M$). Similar conjugation techniques will be used to conjugate halogenated tamoxifen to PBLG.

Any substituted tamoxifen derivative, wherein the halogen substitution is located at a non-aromatic site of the tamoxifen molecule, specifically at the aliphatic side chain (i.e., the C_2H_5 group shown in the native tamoxifen structure), would be capable of functioning as an imaging agent with enhanced estrogen receptor binding affinity. The halogenated tamoxifen derivatives most preferred in the present invention include the bromotamoxifen analogs, such as bromomethyltamoxifen. Of the fluoromethyl derivatives, N-diethylfluoromethyltamoxifen is most preferred. The most preferred iodotamoxifen derivative of the described estrogen receptor radiopharmaceutical agents is iodomethyltamoxifen labeled with ^{131}I . The most preferred bromotamoxifen derivatives of the present invention include the bromomethyltamoxifen analogs labeled with ^{77}Br .

One object of the present invention is to provide an estrogen receptor imaging reagent which has high affinity

for the estrogen receptor and high enough specific activity (>1 ci/ μ mol) to be suitable for use in positron emission tomography. Another object of the invention is to provide an imaging reagent which, as a result of the foregoing characteristics, has superior target tissue selectivity in vivo. Another object of the present invention is to provide a method for monitoring the effectiveness of tamoxifen therapy in treating breast tumors.

10

A further object of the present invention is to achieve a substituted tamoxifen derivative which has both high estrogen receptor binding affinity and high specific radioactivity. More specifically, an object of the present invention is to provide an easy and rapid radiosynthesis of substituted tamoxifen derivative (i.e., with fluoro-, iodo-, chloro-, or bromo- or hydroxy-tamoxifen analogs) with high specific radioactivity (e.g., ^{18}F , ^{131}I , or ^{77}Br) at the aliphatic chain of the tamoxifen structure.

15
20

By providing a molecular substitution (i.e., halogen, halo alkyl or hydroxy group) at the aliphatic chain of the tamoxifen molecule, the bioactivity of the claimed tamoxifen derivatives is preserved through the retention of the majority of the native structure of the molecule, leaving the majority of the molecule available for binding cell (estrogen) receptors.

25

An additional object of the invention is to provide a simple and inexpensive method for radiosynthesizing these derivatives.

30

Methods for preparing the disclosed site specific halogenated tamoxifen derivatives are thus also provided. Currently available methods for directing the

35

substitution of tamoxifen at the aliphatic chain require multiple and time consuming chemical steps. Thus, the formulation of a more efficient and rapid method for preparing halogen alkyl chain substituted tamoxifen derivatives would represent a significant and valuable advance in using particular short half life radiolabeled tamoxifen analogs as radiopharmaceuticals. For example, radionuclide ^{18}F analogs have an extremely short half life of only about 2 hours. Therefore, time is of the essence in processing and using ^{18}F -labeled tamoxifen analog molecules.

An additional object of the present invention is to provide halogenated tamoxifen derivatives which have superior estrogen receptor binding affinities compared to native tamoxifen and to the tamoxifen and progestin derivatives described in the literature.

By way of example, such halogen tamoxifen derivatives of the present invention include fluoro-, iodo-, bromo- and chloro- tamoxifen analogs. In regard to the IC_{50} values, it should be considered that different species (e.g., pig, rat, dog, rabbit) will have different IC_{50} values (for the same compound). However, the K_i should remain the same. Therefore, to report data, one must include a standard sample (e.g., tamoxifen, estradiol, diethylstilbestrol) and compare the relative value to a standard sample. IC_{50} values, therefore, between species cannot be readily compared. Relative binding affinities are more easily comparable. Results of the presently described halogenated alkyl analogs of tamoxifen are therefore expressed in terms of relative binding affinities.

Another object of the present invention is to provide a more stable in vivo reagent. The Inventors

have discovered that one of the advantages of adding halogen atoms to the tamoxifen alkyl chain, instead of at a ring structure of the molecule, is that the molecule has a greater *in vivo* stability. For example, the active metabolite of tamoxifen is formed at the 4-position of the aromatic ring. If a halogen is placed on the phenyl ring, the halogen-substituted site of the molecule will hinder active metabolite formation. Also, *in vivo* elimination of halogen may then occur at the phenyl ring to destroy the halogen-substituted forms of tamoxifen. Thus, halogen substitution on the phenyl ring reduces the amount of active metabolite formation *in vivo*. Substitution of the tamoxifen molecule at the alkyl chain, provides a more stable *in vivo* reagent as the alkyl chain portion of the tamoxifen molecule does not block the hydroxylation reaction which results in the formation of the active metabolite of tamoxifen.

An additional object of the invention is to provide an effective anti-cancer therapeutic agent for reducing estrogen-receptor positive breast, ovarian, and uterine cancer. The described analogs may also be useful as anti-cancer agents of cancers affecting the estrogen receptor-rich tissue of the brain.

An ultimate object of the present invention is to provide a non-steroid based radiopharmaceutical agent, useful in PET, which has high specific radioactivity and high target tissue selectivity by virtue of its high affinity for the estrogen receptor. The tissue selectivity is capable of further enhancement by coupling this highly selective radiopharmaceutical with targeting agents, such as microparticles.

These objects of the present invention are served with the particular aliphatic substituted tamoxifen

derivatives of the present invention. Scatchard analysis of estrogen receptor binding in pig uterus using [H-3]estradiol gave Bmax=376 fmol/mg of protein and Kd=5nM. The IC-50s (μ M) were: TX, 30, FMTX, Cis = 5, trans = 1; ClMTX, cis = 4, trans = 0.4; BrMTX, cis = 0.8, trans = 0.2; ImTX, cis = 3, trans = 2; OHMTX cis = 10, trans = 7. For MCF7 breast tumor cell inhibition, the IC-50 of TX was 11 μ M. The relative potencies were TX = 100; FMTX, cis = 224, trans = 93; ClMTX, cis = 335, trans = 146; BrMTX, cis = 2355, trans = 298; IMTX, cis = 466, trans = 175; OHTX, cis = 66, trans = 50. These results indicate that all of the halogenated analogs of tamoxifen produce greater receptor binding affinity and have more potent tumor cell inhibition than tamoxifen, thus establishing their utility for in vivo imaging of breast tumors.

Additionally, ER binding in pig uterus using [³H] estradiol, Scatchard analysis (N=9) gave Kd = 5nM and Bmax = 376 fmol/mg of protein. The Ki (nM) values were: TX = 15,000; fluoromethy TX (FMTX), cis=2500, trans = 500; iodomethyl - TX (IMTX), cis = 1500, trans = 1,000. In vivo tissue uptakes in rat (% injected dose per organ, n=5) for ¹³¹I-IMTX (trans) at 3h, 6h, and 24h were: uterus, 0.5 \pm 0.04, 0.14 \pm 0.16 and 0.01 \pm 0.001; liver, 5.3 \pm 0.84, 3.0 \pm 0.02, 1.7 \pm 0.21. Uterus/blood ratios were 1.6, 1.5 and 1.2. The IC50 (μ M) values for MCF7 cell inhibition were TX = 11, FMTX, cis = 4.5, trans = 1.8, IMTX, cis = 2.4, trans = 6.3 uterus/muscle ratios were 11.0, 7.6 and 3.6.

The following numerical designation of particular tamoxifen compounds is employed throughout the Specification:

| | | | |
|----|---------------|---|-------------------------------------|
| | Compound I | - | Tamoxifen |
| | Compound II | - | N,N-diethyl-hydroxytamoxifen |
| | Compound III | - | N,N-diethyl-hydroxymethyltamoxifen |
| | Compound IV | - | N,N-diethyl-fluorotamoxifen |
| 5 | Compound V | - | Hydroxytamoxifen |
| | Compound VI | - | N,N-diethyl-fluoromethyltamoxifen |
| | Compound VII | - | Fluorotamoxifen |
| | Compound VIII | - | N,N-diethyl-O-tosyltamoxifen |
| | Compound IX | - | N,N-dimethyl-O-tosylmethyltamoxifen |
| 10 | Compound X | - | N,N-diethyl-iodomethyltamoxifen |
| | Compound XI | - | N,N-diethyl-bromomethyltamoxifen |
| | Compound XII | - | N,N-diethyl-chloromethyltamoxifen |

15 The following abbreviations are included throughout the body of the Specification:

| | | | |
|----|-----------|---|---|
| | BrTX | = | bromotamoxifen |
| | BrMTX | = | bromomethyltamoxifen |
| | ClTX | = | chlorotamoxifen |
| | ClMTX | = | chloromethyltamoxifen |
| 20 | ITX | = | iodotamoxifen |
| | IMTX | = | iodomethyltamoxifen |
| | FTX | = | fluorotamoxifen (VII) |
| | FMTX | = | fluoromethyltamoxifen |
| | TX | = | tamoxifen (I) |
| 25 | B_{max} | = | the total number of binding sites determined from Scatchard analysis. |
| | E_2 | = | estradiol |
| 30 | IC_{50} | = | the concentration of test compounds that decreases 50% of specific radioligand binding in receptor assay or 50% of cell viability in MCF-7 cell growth assay. |
| | PET | = | positron emission topography |
| 35 | K_d | = | dissociation constant determined from a saturation estrogen receptor assay and a Scatchard analysis. |

ER = estrogen receptor
FMTX = Fluoromethyltamoxifen
K_i = inhibition constant determined using the
equation

5

$$K_i = \frac{IC_{50}}{1 + [^3H] \text{ estradiol}/K_d}$$

10

RBA = relative binding affinity,
the relative concentration
of estradiol and tamoxifen
or its derivatives required
to achieve 50% inhibition
of [³H]-E₂ binding.

15

RP = relative potency
TX = Tamoxifen

20

20 The present invention discloses aliphatic chain-substituted tamoxifen derivatives having markedly enhanced estrogen receptor binding affinity compared to native forms of tamoxifen. The tamoxifen derivatives may include a halogen, a hydroxy or a lower haloalkyl moiety. Any of the halogen molecules Br, Cl, I, or F may be employed in the described site-specific halo and haloalkyl tamoxifen derivatives. Particularly preferred
25 halotamoxifen derivatives of the present invention include fluorotamoxifen (FTX), iodotamoxifen (ITX), bromotamoxifen (BrTX), and chlorotamoxifen (ClTX) iodomethyltamoxifen (IMTX). By way of example, these lower haloalkyltamoxifen derivatives include cloromethyl
30 tamoxifen (ClMTX).

35 The present invention also includes radiolabeled forms of tamoxifen. The radiolabeled forms of the substituted tamoxifen derivatives provide reagents having high specific activity. These radiolabeled tamoxifen derivatives are demonstrated to be particularly useful in estrogen receptor mapping in estrogen rich tissues, such as the uterus and breast.

40 Unlabeled forms of the described fluorotamoxifen derivatives were prepared from hydroxytamoxifen via

diethylaminosulfur trifluoride reaction at a 47% product yield. The binding affinity of these particularly synthesized fluorotamoxifen derivatives to cytosol estrogen receptors of pig uteri *in vitro* was higher (K_i is 500 nM; *trans*-compound VI) than the binding affinity observed between estrogen receptors and native tamoxifen (K_i is 15,000 nM).

Unlabeled forms of iodomethyltamoxifen were prepared from tosyl analogs of tamoxifen by reacting with sodium iodide. The binding affinity of iodotamoxifen was 10-15 fold higher than tamoxifen. The unlabeled forms of chloromethyltamoxifen or bromomethyltamoxifen were prepared by treatment of a tamoxifen hydroxy precursor with SOCl_2 or CBr_4 , respectively, to provide chloromethyltamoxifen and bromomethyltamoxifen in 87% and 50% yields, respectively.

Radiosynthesis with fluorine-18 was performed on tosyl tamoxifen analogs to produce radiolabeled fluorotamoxifen molecules having the described high specific activity (2-4 Ci/ μmol) and a radiochemical yield of 60%. Radiochemical purity was > 99%. Radiosynthesis of ^{131}I -labeled analogs (Compound X) of tamoxifen was performed by reacting tosyl analogs of tamoxifen with NaI. The radiochemical yield was 60%.

The fluoromethyl tamoxifen, chloromethyl tamoxifen, bromomethyl tamoxifen and iodomethyltamoxifen analogs were found to bind to cytosol estrogen receptors of pig uteri and ovaries. IC-50's (μM) for F, Cl, Br, I, and native tamoxifen (TX) were found to be 1, 0.4, 0.2, 2 and 30. These results demonstrate that these halogenated derivatives are effective competitive ligands of [^3H]estradiol (5 nM).

Clomiphene, estradiol, and tamoxifen were obtained from Sigma Chemical Company (St. Louis, MO). Flash chromatography according to the procedure of Still et al.⁷ was used. Silica gel Sep-Paks from Waters Associates (Milford, MA) were used for purifications. Thin-layer chromatographic (TLC) analysis was performed on Whatman K6F silica gel-packed plates (250 μ m) (Anspec, MI). [³H]estradiol (specific activity 160 Ci/mmol) for receptor binding was purchased from Amersham (Arlington Heights, IL). The no-carrier-added Na¹³¹I was purchased from Syncore. High pressure liquid chromatography (HPLC) was carried out on a LDC system, consisting of two LDC ConstaMetric Pumps, a Rheodyne injector and a Spectra Physics model SP8450 variable UV/Vis detector.

Melting points were determined on a Meltemp melting point apparatus and are uncorrected. ¹HNMR spectra were obtained from a GE 300 MHz instrument, and mass spectral data were obtained by direct probe analysis (Finnigan MAT INCOS-50) at The University of Texas Health Science Center, Houston, Texas. Elemental analyses were performed by Galbraith Laboratories, Inc., Knoxville, TN.

Improved and more efficient methods for the synthesis of all of the described halogenated tamoxifen analogs, including N,N-diethylfluorotamoxifen, fluoromethyl-N,N-diethyltamoxifen, N,N-diethylbromomethyltamoxifen, N,N-diethylchloromethyltamoxifen and iodomethyl-N,N-diethyltamoxifen are also disclosed as part of the invention. For example, the synthesis of fluoromethyltamoxifen and iodotamoxifen (lower alkyl halotamoxifen derivatives) has been simplified from an at least ten (10) step procedure to a more rapid and simple three-step procedure (Figure 1). The N,N-diethylfluoro (Compound IV) and the N,N-diethylfluoromethyl (Compound VI) and N,N-diethyliodomethyl (Compound X) analogs of

tamoxifen were prepared for preliminary evaluation according to these improved protocols. N,N-Diethylfluoro (IV), N,N-diethylfluoromethyl (VI) and N,N-diethyliodomethyl (X) analogues of tamoxifen were prepared from the corresponding hydroxy analogues of tamoxifen via tosyl analogues by displacement with either sodium fluoride or sodium iodide. N,N-diethylbromomethyltamoxifen (XI) and N,N diethylchloromethyltamoxifen (XII) analogs of tamoxifen were prepared from the corresponding hydroxy precursors of tamoxifen with CBr_4 or SOCl_2 , respectively. Mixtures of the *cis*- and *trans*-isomers of the respective alkyl-chain substituted tamoxifen derivatives were obtained from this synthesis.

The *cis*- and *trans*- isomer products of each of the reactions described above were separated by passing the reaction mixture through a silica gel-packed column and eluting with ether/petroleum ether/triethylamine (1:1:0.1). The ^1H NMR chemical shift signals for *cis*- and *trans*-isomers were assigned based on published information.^{8,11}

It was ascertained that the tosyl group on N,N-diethyl-O-tosyltamoxifen could be displaced by nucleophilic fluoride substitution reaction with a milder condition (e.g. kryptofix-222 and KF). Using this procedure, the fluoro-analogue of tamoxifen, compound IV, was prepared in 40% yield from the corresponding tosyl derivative of hydroxytamoxifen. However, elimination occurred to form the butadiene by-product in the presence of the stronger base (e.g. tetrabutylammoniumhydroxide). The formation of the butadiene by-product is due to an elimination reaction on the tosyl analogue.

Synthesis of Aliphatic Halotamoxifen Derivatives

| Compound | R |
|----------|---|
| VI | F |
| X | I |

Increasing the side chain by one carbon results in the synthesis of *Cis*-*N,N*-diethylfluoromethyltamoxifen (VI), which is more stable toward tosyl elimination. The yield for compound VI was 60%. Compound VI showed a 6-fold (*cis*) and 30-fold (*trans*) higher affinity for the estradiol receptor binding site than native tamoxifen. The yield for Compound X was 50% (*trans*) and 70% (*cis*). Compound X showed a 10-fold (*cis*) and 15-fold (*trans*) higher ER affinity than tamoxifen. Receptor binding affinity of fluorotamoxifen, with a fluorine atom placed on the phenyl ring of tamoxifen, and of iodotamoxifen, with an iodine atom placed on the phenyl ring of tamoxifen, has been reported.^{22, 23} However, that reaction for fluorotamoxifen preparation takes longer and yields lower specific radioactivity for ¹⁸F-labeled tamoxifen, which is not practical for estrogen-receptor studies using PET.

The iodine atom placed on a phenyl ring at the 2-position next to the phenoxy ring gave poor estrogen receptor binding. The iodine atom placed on the 4-position of the aromatic ring gave good receptor binding¹³, yet it may be unstable in vivo due to an elimination reaction, resulting in formation of the active hydroxy metabolite. Also, the iodine atom is quite bulky, and may change the planar conformation (e.g., phenyl ring) impairing the binding to estrogen receptors, thereby decreasing binding affinity.

As used in the present invention, the term "lower alkyl" refers to a carbon chain of less than 5 carbon atoms in length. Most preferably the lower alkyl comprises 1 carbon (methyl) or 2 carbons (ethyl).

The following Examples are presented only to describe preferred embodiments and utilities of the present invention, and to satisfy best mode requirements. The examples are not meant to limit the scope of the present invention unless specifically indicated otherwise in the claims appended hereto.

EXAMPLE 1 - SYNTHESIS OF TRANS-FLUOROTAMOXIFEN
(COMPOUND VII)

Hydroxytamoxifen (trans) (V) (8) (330 mg, 0.85 mmol) was dissolved in methylene chloride (20 ml), cooled to -40°C and then treated with triethylamine (200 µl) added. Diethylaminosulfur trifluoride (250 µl, 1.89 mmol) was added and the reaction mixture was stirred for 1 hour at -40°C according to our previous published method.⁹ The reaction mixture was then washed with water and the methylene chloride layer evaporated to dryness. The reaction mixture was chromatographed on a silica gel

column using 1:1:0.1 hexane/ethylacetate/triethylamine as eluant to yield 145 mg (43.7%) of VII:R_f 0.40 (1:1:0.1 ether/petroleum ether/triethylamine); ¹HNMR (CDCl₃) δ 2.29 (s, 6, NMe₂) 2.66 (t, J= 5.6Hz, 2, OCH₂CH₂N), 2.87 (dt, J=21.2 Hz, 6.3Hz, 2, CH₂CH₂F), 3.93 (t, J=5.5 Hz, 2, OCH₂CH₂N), 4.34 (dt, J= 47.2 Hz, 6.3Hz, 2, CH₂F), 6.56 (d, J= 8.5Hz, 2, ArH 3,5 to OCH₂), 6.77 (d, J= 8.3 Hz, 2, ArH 2,6 to OCH₂), 7.12-7.35 (m, 10, ArH); m/z 389 (12, M⁺), 342 (30, ⁺CH₂-CH₂-F).

10

EXAMPLE 2 - SYNTHESIS OF N,N-DIETHYLHYDROXYTAMOXIFEN (COMPOUND II)

Clomiphene (6.06 g, 14.9 mmol) was dissolved in tetrahydrofuran (100 ml) and cooled to -40°C. t-Butyl lithium (1 M in pentane, 24 mmol) was added slowly. After 5 minutes, ethylene oxide (14.6 ml, 290 mmol) was added, and the reaction mixture was stirred for 6 hours, poured into water and extracted with ether. The ether layer was evaporated and chromatographed on a silica gel column using 1:1:0.1 ether/petroleum ether/triethylamine as eluant to yield trans product (1.96 g, 27.1%, oil): and cis product (1.56 g, 21.5%, oil): Assignment of ¹HNMR for aliphatic protons are presented in Table 1.

25

EXAMPLE 3 - SYNTHESIS OF N,N-DIETHYL-O-TOSYLTAMOXIFEN (COMPOUND VIII)

Cis- or trans- N,N-diethylhydroxytamoxifen (II) (100 mg, 0.27 mmol) was dissolved in methylene chloride (2 ml) and cooled to 0°C. Pyridine (150 µl) and tosyl chloride (55 mg, 0.27 mmol) were added. After 2 hours, the reaction mixture was diluted with methylene chloride and washed with water. The methylene chloride layer was evaporated and chromatographed on a ¹⁸C column using 85:15:1 acetonitrile/water/triethylamine as eluant to yield cis (51 mg, 34%, oil) or trans tosyl analog (30 mg,

35

20%, oil): m/z 569(60, M^+), 397(20, $^{+}OSO_2PhCH_3$). Values for aliphatic protons are presented in Table 1.

EXAMPLE 4 - SYNTHESIS OF N,N-DIETHYLFLUOROTAMOXIFEN
(COMPOUND IV)

5

The present example is provided to demonstrate two methods by which compound IV may be prepared.

10 Method 1

Cis or *trans* N,N-diethylhydroxytamoxifen (II) (400 mg, 0.96 mmol) was dissolved in tetrahydrofuran (25 ml), and the solution was cooled to $-40^{\circ}C$. A solution of triethylamine (480 μ l) was added. Diethylaminosulfur trifluoride (1280 μ l, 2.11 mmol) was added and the reaction mixture was stirred for three hours at $-40^{\circ}C$. The crude material was poured into water and then extracted with ether. The ether layer was dried over anhydrous magnesium sulfate, filtered and evaporated to dryness. The mother liquor was chromatographed on a silica gel packed (3 x 60 cm, ACE Gloss) column using 1:1:0.1 ether/petroleum ether/triethylamine to yield purified 60 mg (15%) of *trans* IV (oil): R_f 0.70, and 80 mg (20%) of *cis* IV (oil), R_f 0.60 (1:1:0.1 ether/petroleum ether/triethylamine); *trans* 1H NMR ($CDCl_3$) δ 1.02(t, $J=7.3$ Hz, 6, (CH_3CH_2N) , 2.57 (q, $J=7.1$ Hz, 4, CH_3CH_2N), 2.78(t, $J=6.3$ Hz, 2, OCH_2CH_2N), 2.91 (dt, $J=21.5$ Hz, 6.3 H, 2, CH_2CH_2F), 3.90 (t, $J=6.2$ Hz, 2, OCH_2CH_2N), 4.33 (dt, $J=47.4$ Hz, 6.3 Hz, 2, CH_2CH_2F), 6.56 (d, $J=8.5$ Hz, 2, ArH 3,5 to OCH_2), 6.75 (d, $J=8.7$ Hz, 2, ArH 2,6 to OCH_2), 7.12-7.37 (m, 10, ArH); m/z 417(50, M^+) Hz. Anal. ($C_{28}H_{32}NOF \cdot 1/3 H_2O$) C, H, N. Calc., C:79.40, H:7.70, N:3.31; Found, C:79.71, H:7.61, N:3.36. *cis* 1H NMR ($CDCl_3$) δ 1.08 (t, $J=7.1$ Hz, 6, CH_3CH_2N), 2.64 (q, $J=7.3$ Hz, 4, CH_3CH_2N), 2.89-2.96 (m, 4, OCH_2CH_2N and CH_2CH_2F), 4.06 (t, $J=6.4$ Hz, 2 OCH_2CH_2F), 4.35(dt, $J=47.1$ Hz, 6.4 Hz, 2,

35

$\text{CH}_2\text{CH}_2\text{F}$), 6.89-7.26 (m, 14, ArH); m/z 417 (70, M+), 402 (30). m.p. 55-57°C Anal. ($\text{C}_{28}\text{H}_{32}\text{NOF} \cdot 0.5 \text{H}_2\text{O}$) C, H, N, calc., C:78.84, H:7.80, N:3.28; Found, C:78.71, H:7.48, N:3.20

5 Method 2

N,N-Diethyl tosyl analogue of tamoxifen (VIII) (40 mg, 0.07 mmol) was dissolved in tetrahydrofuran (200 μl) and then treated with tetrabutylammonium fluoride (170 μl , 1M in tetrahydrofuran). Fifteen minutes after adding
10 TBAF, two spots were visualized by silica gel TLC (4:1 chloroform/methanol). Both products were isolated from a silica gel Sep-Pak by elution with ether/petroleum ether/triethylamine (1:1:0.1). One product isolated was the trans isomer of compound (IV) (11 mg, 40%) and the
15 other was a butadiene derivative (30%, oil). Butadiene derivative ^1H NMR (CDCl_3) δ 1.08 (t, J= 7.0 Hz, 6, $\text{CH}_3\text{CH}_2\text{N}$), 2.65 (q, J= 7.0 Hz, 4, $\text{CH}_3\text{CH}_2\text{N}$), 2.90 (t, J= 6.0 Hz, 2, $\text{OCH}_2\text{CH}_2\text{N}$), 4.08 (t, J= 6.0 Hz, 2, $\text{OCH}_2\text{CH}_2\text{N}$), 4.94 (d, J= 17.2 Hz, 1m $\text{CH}=\text{CH}_2$), 5.17 (d, J= 10.9 Hz, 1, $\text{CH}=\text{CH}_2$), 6.78-7.26 (m, 9, ArH and $\text{CH}=\text{CH}_2$). m/z 397 (60, M⁺). Anal. ($\text{C}_{28}\text{H}_{31}\text{NO} \cdot 1.5 \text{H}_2\text{O}$) C, H, N. Calc., C:79.21, H: 8.06; N:3.30; Found, C:79.76, H:7.56, N:3.09.

1,5 H_2O indicates that the sample is either not dry
25 enough or hygroscopic.

EXAMPLE 5 - SYNTHESIS OF N,N-DIETHYLHYDROXYMETHYL TAMOXIFEN (COMPOUND III)

30 Clomiphene (3.8 g, 9.3 mmol) was dissolved in tetrahydrofuran (50 ml), cooled to -40°C and then treated with t-butyl lithium (1 M in pentane, 20 mmol). After 10 minutes, trimethylene oxide (6 ml, 93 mmol) was added, the mixture stirred for 16 hours at room temperature, and
35 then poured into water. The product was extracted with ether and chromatographed on a silica gel column using

1:1:0.1 ether/petroleum ether/ triethylamine as eluant to yield purified trans-product (1 g, 25%), m.p. 93-95°C and cis product (N,N-diethylhydroxymethyl tamoxifen) (1.0 g, 25%), m.p. 85-87°C. Anal. ($C_{29}H_{35}NO_2$) C,H,N: Calc., C:81.08, H:8.21, N:3.26; Found, C:80.56, H:7.94, N:3.32. Values for aliphatic protons are presented in Table 1.

EXAMPLE 6 - SYNTHESIS OF CIS-N,N-DIETHYL-O-TOSYLMETHYLTAMOXIFEN (COMPOUND IX)

10

Cis-N,N-diethylhydroxymethyltamoxifen (500 mg, 1.17 mmol) (III) was dissolved in methylene chloride (20 ml), and the solution cooled to 0°C. Pyridine (0.66 ml) and tosyl chloride (266 mg, 1.40 mmol) were added. After 4 hours, the reaction mixture was diluted with additional methylene chloride (20 ml) and washed with water, dried over magnesium sulfate, filtered, and evaporated to yield 476 mg. The crude mixture was chromatographed on a ^{18}C reverse phase column using 85:15:1 acetonitrile/water/triethylamine as eluant to yield the purified cis tosyl analogue of IX (200 mg, 29%, oil) R_f 0.35 (silica gel plates, ether/petroleum ether/triethylamine 1:1:0.1), m/z 583(10, M^+). Values for aliphatic protons are presented in Table 1.

25

EXAMPLE 7 - SYNTHESIS OF N,N-DIETHYLFLUOROMETHYLTAMOXIFEN (COMPOUND VI)

The cis- or trans-tosyl analogue of IX (117 mg, 0.2 mmol) was dissolved in tetrahydrofuran (400 μ l) according to the inventors' reported procedure.⁹ Tetrabutylammonium fluoride (485 μ l, 1 M in tetrahydrofuran) was added, and the reaction was warmed to 80°C. After 30 minutes, the reaction was completed. The mixture was then hydrolyzed with 6N HCl 6.2 ml for 10 min. The product was chromatographed on a silica gel column, which was eluted with 1:1:0.1 ether/petroleum

ether/triethylamine to yield 52 mg (60%, oil) of purified *cis* fluoro product (VI) or 40 mg (46% oil) of *trans* product R_f :0.80 (silica gel plates, ether/petroleum ether/triethylamine 1:1:01), m/z 431(40, M^+). Anal.

5 (C₂₉H₃₄NOF) C,H,N: Calc., C:80.71, H:7.94, N:3.25; Found, C:80.39, H:8.02, N:3.13 (*cis*) or C:79.58, H:8.01, N:3.20; ¹HNMR AND ¹³C-NMR data are shown in Table 2.

10 EXAMPLE 8 - PREPARATION OF N,N-DIETHYLEODOMETHYLTAMOXIFEN
(COMPOUND X)

Tosyl analog of tamoxifen (117 mg. 0.2 mmol) was dissolved in acetone (15 ml). Sodium iodide (150 mg, 1.0 mmol) was added, and the reaction was refluxed for 6h.

15 The mixture was evaporated to dryness and chromatographed on a silica gel column using ether/petroleum ether/triethylamine (1:1:15%) eluant to yield *cis* 75 mg (70%) R_f 0.50; or *trans* 54 mg (50%), R_f 0.65 (1% triethylamine in ether/petroleum ether; 1:1). m/z 539 (M^+ , 100), 524(20), 312(30), 191(30), 100(60), 86(100).
20 *trans* m/z 539 (M^+ , 100), 524(30), 452(20), 312(20), 191(30), 100(60), 86(100). The ¹HNMR and ¹³CNMR assignments are shown in Table 3.

25 The end product N,N-Diethyliodomethyltamoxifen will then be radiolabeled with ¹³¹I, as described in Example 12.

30 EXAMPLE 9--SYNTHESIS OF N,N-DIETHYLBROMOMETHYLTAMOXIFEN
(COMPOUND XI)

The present example is provided to demonstrate the most preferred method and best mode for preparing the bromo-tamoxifen analogs of the present invention.

35 Generally, the bromomethyl-tamoxifen analogs were prepared by treatment of hydroxy precursor with CBr₄ in 50% yields. The IC-50 with (μm) per Br was 0.2. The

bromomethyl-Tx analogs were found to bind to estrogen receptors greater than other halogenated tamoxifens tested with F, Cl, or I.

5 **Synthesis**

1-[4-(2-Diethylaminoethoxy)phenyl]-1,2-diphenyl-5-bromo-1-entene (N,N-Diethylbromomethyltamoxifen)

Triphenylphosphine (105 mg, 0.4 mmol) was added to a stirred solution of hydroxymethyltamoxifen (85 mg, 0.2 mmol) (1) and carbon tetrabromide (100 mg, 0.6 mmol) in THF (10 ml). After 2h, the reaction mixture was filtered and the filtrate was evaporated to dryness. The mixture was reconstituted in chloroform (100 μ l) and chromatographed on a silica gel column using ether/petroleum ether/triethylamine (1:1:10%) as eluant to yield the *cis* (36 mg, 37%) or *trans* (39 mg, 40%) product. Elemental analysis - (C₂₉H₃₄NOBr) C,H,N: Calc. 21
Trans - C:70.72, H:6.96, N:2.84; Found Trans - C:70.45, H:7.11, N:2.68; Calc. *Cis*(H₂O) - C:68.29, H:7.11, N:2.99, Found *Cis* - C:68.70, H:7.63, N:2.74. Trans - m/z 493 (20m), 491 (20); *Cis* - m/z 493 (20, M+), 491(20), 267 (20), 252 (30), 191 (40), 86 (100).

25 **EXAMPLE 10--SYNTHESIS OF N,N-DIETHYLCHLOROMETHYLAMOXIFEN COMPOUND (XII)**

The present example is provided to demonstrate the most preferred method and best mode for preparing the chloro-tamoxifen analogs of the present invention. Generally, the chloromethyl analogs were prepared by treatment of hydroxy precursor with SOCl₂ (87% yield). The IC-50 (μ M) for Cl was 0.4.

Synthesis

1[4-(2-Diethylaminoethoxy)phenyl]-1,2-diphenyl-5-chloro-1-pentene (N,N-Diethylchloromethyltamoxifen)

- 5 Thionyl chloride (1 ml) was added to stirred solution of *cis* or *trans* hydroxymethyltamoxifen (110 mg, 0.26 mmol) in benzene (25 ml). The mixtures were refluxed for 1h. Thin-layer chromatography indicated one spot ($R_f=0.45$, Et₂O/petroleum ether/triethylamine; 10 1:1:10%). The reaction mixtures were evaporated and passed through a silica-gel Sep-Pak column eluted with Et₂O/petroleum ether/triethylamine (1:1:10%). The *cis* isomer obtained was 100 mg (87%); the *trans* isomer was 90 mg (78%). HPLC analysis showed that the retention time 15 for *cis* isomer was 5.17 min and *trans* isomer was 5.34 min at flow rate 2 ml/min, U.V. = 254 nm, on a C-18 column, mobile phase: acetonitrile:water:triethylamine (85:15:1%); U.V. = 254 nm. Elemental analysis - (C₂₉H₃₄NOCl) C,H,N: Calc. (*cis*=*trans*) - C:77.74, H:7.65, 20 N:3.12, Found *Cis* - C:77.28, H:7.83, N:3.01; Found *Trans* - C:77.45, H:7.73, N:2.87. *Trans* - m/z 450 (20, M+), 448 (60), 447 (100); *Cis* - m/z 450 (15, M+), 448 (45), 447(50);

**EXAMPLE 11 - ^1H -NMR AND ^{13}C -NMR ASSIGNMENT
OF FLUOROTAMOXIFEN DERIVATIVES**

^1H NMR Assignment

- 5 Assignment of ^1H -NMR for compound VI and X was done
by two dimensional NMR which includes COSY, Long Range
COSY and HC COSY, Long Range HC COSY (COSY Homonuclear
Chemical Shift Correlation). The aromatic portion is
subdivided into three isolated spin systems at 200 MHz.
- 10 In the *trans* isomer, two spin systems were readily estab-
lished for aromatic protons a and b (Shanni, 1985;
McCague, 1988). For compound VI, a correlation among the
H1 methylene protons (resonates at 2.76 ppm for *cis* and
2.55 ppm for *trans*), the H2 geminal methylene protons
15 (resonates at 1.79 ppm for *cis* and 1.80 ppm for *trans*)
and H3 protons (resonates at 4.38 ppm for *cis* and 4.42
ppm for *trans*) was observed during the analysis of the
COSY Spectrum as shown in Table 4. In addition, the
protons at the 4 and 5 - ethylene bridge correlated with
20 each other using the COSY spectrum analysis. H-5
resonates down field at 3.99 ppm (*cis*) and 3.91 ppm
(*trans*) whereas H-4 resonates at 2.8 ppm (*cis*) and 2.79
ppm (*trans*). H-6 protons of the ethyl group showed a
gradruplet (resonates at 2.57 ppm for *cis* and 2.57 ppm
25 for *trans*) which directly correlates with H-7 methyl
protons at 1.01 ppm (*cis*) and 1.03 ppm (*trans*). The
 ^1H NMR data are shown at Table 2.

TABLE 2 - ¹H NMR DATA OF TAMOXIFEN DERIVATIVES
 (Carbon number shown at Table 5) < *****

EXAMPLE 12 - RADIOSYNTHESIS OF
[^{18}F] FLUOROMETHYLTAMOXIFEN AND [^{131}I] IODOMETHYLTAMOXIFEN
FROM FLUOROMETHYL TAMOXIFEN AND IODOMETHYL TAMOXIFEN

[^{18}F]Fluoride was produced at the University of Texas Health Science Center, Cyclotron Facility, by proton irradiation of [^{18}O]water (99.4% isotopic enrichment, ISOTEC INC., Miamisburg, OH) in a small volume silver target. Aliquots containing 50-60 mCi of ^{18}F were combined with kryptofix 222 (26 mg) and potassium carbonate (4.6 mg) and dried in a vacutainer tube by azeotropic distillation with dry acetonitrile. The remaining kryptofix/[^{18}F]fluoride was resolubilized in acetonitrile (3 ml).

[¹⁸F] FLUOROMETHYLTAMOXIFEN

In a typical procedure, potassium [¹⁸F]fluoride (from azotropic evaporation of ¹⁸F (H₂¹⁸O) in acetonitril in the presence of K₂ (03 and Kryptofix 2,2,2) (3 mCi, 200 μl) was transferred to a reaction vessel with the tosylmethyl analog of tamoxifen (compound IX N,N-dimethyl-O-tosylmethyltamoxifen) (1 mg). Tosylmethyl analog was prepared essentially as described in Example 6. The vessel was sealed and warmed at 100°C for 20 minutes, treated with 6 N HCl (200 μl), heated for an additional 10 min, and then spotted on a silica gel coated TLC plate for separation (ether/petroleum ether/triethylamine; 1/1/10% or chloroform/methanol; 9/1).

Authentic non-labeled fluorotamoxifen was used to confirm the presence of F-18 labeled compound. The TLC plate was cut into 0.5 cm zones for counting the activity. Using a Davidson multichannel analyzer fitted with a well type NaI crystal with appropriate shielding. The radiochemical yield was determined as 60%. The reaction mixture was passed through a silica Sep-Pak eluted with 10% triethylamine in ether/petroleum ether (1/1). The radiochemical purity was examined using HPLC (C-18 Radial-Pak column, 8x100 mm, 1% triethylamine in acetonitrile/water [85/15], flowrate of 1.5 ml/min). The retention time of compound VI (N,N-diethylfluoromethyltamoxifen) was 5.60 min. Radiochemical purity was >99%. A typical batch had a specific activity of approximately 4-6 Ci/μmol.

[¹³¹I] IODOMETHYLTAMOXIFEN

For a typical ¹³¹I displacement experiment, Na¹³¹I (1mCi) was added to a vial containing tosylmethyltamoxifen (IX) (2mg) in acetone. The reaction was heated at 100°C for 30 min. and 6 N HCl was added. After 20 minutes, the vial was cooled and the reaction

mixture was chromatographed on a silica-gel Sep-Pak column eluted with 1% triethylamine in ether:petroleum ether (1:1). The purity of the [131-I] labeled tamoxifen analog was assessed by HPLC and compared to authentic compound. The HPLC retention time for Compound X was 22 minutes (Acetonitrile:water:triethylamine [85:15:1]).

**EXAMPLE 13 - IN VITRO ESTROGEN RECEPTOR BINDING -
VARIOUS TAMOXIFEN DERIVATIVES**

10

The present example demonstrates the ability of the described fluorotamoxifen and iodotamoxifen derivatives to bind estrogen receptors *in vitro* and to demonstrate the utility of employing these tamoxifen derivatives *in vivo* in various diagnostic and therapeutic applications involving imaging of estrogen receptor-containing tissues.

The relative binding affinity of the tamoxifen derivatives synthesized in Examples 1-8 and of native tamoxifen (Compound I) to estrogen receptor was determined a previously reported procedure was modified by the Inventors and used for this purpose.^{10, 11} TEA buffer was used by the Inventors for tissue preparation.

25

Briefly, uteri (90 gm) were obtained from immature domestic swine (15kg) was homogenized in Tris buffer (10 mM, pH 7.4) (1 uterus/180 ml), which contained EDTA (1.5 mM) and sodium Azide (3 mM). The homogenate was centrifuged at 100,000 g for 1 hour at 4°C. Uteri cytosol (contains 2% of protein from corresponding uterus tissue) were then pretreated with dextran-coated charcoal as described.¹⁰ Protein concentrations were determined according to the method of Lowry et al.¹²

30
35

To investigate the nature of the interaction of estradiol with the estrogen receptor site, a saturation curve (Figure 2) was obtained for [^3H]estradiol (10^{-5} M to 10^{-10} M) in the presence or absence of excess estradiol (2×10^{-5} M). Uteri cytosol (2 mg protein/tube) were incubated at 4°C for 2 h with [^3H]estradiol (5 nM/tube) and competitor [ranging from 10^{-4} M to 10^{-8} M ("specific") or with 10^{-5} M estradiol (non-specific)].

10 A Scatchard analysis indicated a single class of binding sites with a mean K_d of 5 nM ($n=9$) and a mean B_{max} of 376 fmol/mg protein with a Hill coefficient of 0.982 (Figure 3).

15 Various tamoxifen derivatives were then tested for their ability to displace the [^3H]estradiol (5 nM) bound to estrogen receptors in this *in vitro* pig uterus system. From these experiments, the concentration of test compounds which decreased 50% of specific radioligand binding (IC_{50}) and the inhibition constant (K_i) were determined⁹ for various tamoxifen derivatives and the results summarized in Table 4.

25 Tamoxifen (I) (i.e., the fluorotamoxifen derivative) binds to the estrogen receptor with high affinity as tamoxifen ($K_i = 15,000$ nM) (Table I). The affinity of the *trans* isomer of *N,N*-diethylfluorotamoxifen (IV) for the estrogen receptor is two and a half times that of tamoxifen. In addition, the *trans* isomer has a higher binding affinity than the *cis* isomer. Increasing the side chain by one carbon resulted in the formation of fluorinated compound VI, which showed a 6-fold (*cis*) and 30-fold (*trans*) higher affinity for the estradiol binding site than tamoxifen. The iodinated compound (X) showed 35 10-15 fold higher estrogen receptor affinity than native tamoxifen.

TABLE 5 - STRUCTURES AND RELATIVE BINDING
AFFINITIES OF TAMOXIFEN DERIVATIVES

| Compound | R | X | RBA* | IC ₅₀ (M) | K _i (nM) |
|------------------|-------------------------------|-----------------------------|--------|----------------------|---------------------|
| I (Tamoxifen) | CH ₃ | H | 100 | 3x10 ⁻⁵ | 15,000 |
| II | C ₂ H ₅ | OH | | | |
| III (Cis) | C ₂ H ₅ | CH ₂ OH | 300 | 1x10 ⁻⁵ | 5,000 |
| (trans) | | | 400 | 7x10 ⁻⁶ | 3,500 |
| IV (Cis) | C ₂ H ₅ | F | 100 | 3x10 ⁻⁵ | 15,000 |
| (trans) | | | 250 | 1.2x10 ⁻⁵ | 6,000 |
| V | CH ₃ | OH | | | |
| VI (Cis) | C ₂ H ₅ | CH ₂ F | 600 | 5x10 ⁻⁶ | 2,500 |
| (trans) | C ₂ H ₅ | CH ₂ F | 3,000 | 1x10 ⁻⁶ | 500 |
| VII (trans) | CH ₃ | F | 100 | 3x10 ⁻⁵ | 15,000 |
| VIII | C ₂ H ₅ | O- tosyl | - | - | - |
| IX | C ₂ H ₅ | CH ₂ O- tosyl | | | |
| X (cis) | C ₂ H ₅ | CH ₂ I | 1,000 | 3x10 ⁻⁶ | 1,500 |
| (trans) | | | 1,500 | 2x10 ⁻⁶ | 1,000 |
| Estradiol | | | 15,000 | 2x10 ⁻⁷ | 100 |

* The relative binding affinity (RBA) for the pig uteri estrogen receptor is the ratio between the concentration of unlabeled tamoxifen and the competitor (x 100) (i.e., tamoxifen is 100 as the standard) required to decrease the amount of bound [³H]estradiol by 50%. Incubation was done at 4°C. The data was reproduced in triplicate. The protein concentration was determined to be 1 mg per tube.

EXAMPLE 14

IN VITRO ESTROGEN RECEPTOR BINDING -
COMPARISON OF HALOGENATED TAMOXIFEN DERIVATIVES

5 The present example is presented to demonstrate the estrogen binding activity of various halogenated tamoxifen analogs. The particular halogenated tamoxifen analogs employed in the present study include:

10 chloromethyltamoxifen (CMTX);
 bromomethyltamoxifen (BrMTX);
 fluoromethyltamoxifen (FMTX);
 iodomethyltamoxifen (IMTX)

15 The estrogen receptor binding assay used in the present example was essentially the same as described in Example 13.

20 Non-radiochemical forms of the fluoromethyltamoxifen and the iodomethyltamoxifen were prepared by reacting tosylmethyltamoxifen with KF/kryptofix or NaI resulting in 65% and 47% yields, respectively. The radiochemical yields for [^{18}F]FMTX and [^{131}I]IMTX were 48% and 40%.

25 The chloromethyltamoxifen and bromomethyltamoxifen analogs were prepared by treatment of hydroxytamoxifen precursor with SOCl_2 or CBr_4 resulting in 87% and 50% yields, respectively.

30 The IC_{50} 's for fluormethyl, chloromethyl, bromomethyl and iodomethyl (F, Cl, Br, I and TX) were 1, 0.4, 0.2, 2 and 30 μM , respectively. These data demonstrate that halogenated tamoxifen analogs, as described herein,
35 compete with [^3H]estradiol (5 nM) in binding estrogen receptors.

Bromomethyl tamoxifen, as demonstrated in Table 6, binds to estrogen receptors with greater affinity than the other halogenated tamoxifen analogs tested. These alkyl halogenated tamoxifen analogs, particularly the bromo analogs, are thus expected to be particularly efficacious in the mapping estrogen receptors.

TABLE 6
EFFECT OF HALO ALKYL (METHYLATED) TAMOXIFEN ANALOGS ON
ESTROGEN RECEPTOR BINDING¹

| Compound | IC ₅₀ (uM) ² | RBA ³ |
|------------------------|------------------------------------|------------------|
| F <i>trans</i> | 1 | 30 |
| F <i>Cis</i> | 5 | 6 |
| Cl <i>trans</i> | 0.4 | 75 |
| Cl <i>Cis</i> | 4 | 7.5 |
| Br <i>trans</i> | 0.2 | 150 |
| Br <i>Cis</i> | 0.8 | 37.5 |
| I <i>trans</i> | 2 | 15 |
| I <i>Cis</i> | 3 | 10 |
| Tamoxifen <i>trans</i> | 30 | 1 |
| OH <i>trans</i> | 7 | 4 |
| OH <i>Cis</i> | 10 | 3 |

1. Each value shown for IC₅₀ and RBA represents the average of three experiments. In each experiment, triplicate samples were tested.
2. IC₅₀: Concentration required to decrease the amount of bound [³H]estradiol by 50%.
3. RBA: Relative binding affinity is the IC₅₀ ratio between tamoxifen and competitor (x100).

**EXAMPLE 15 - INHIBITION OF BREAST TUMOR CELL GROWTH
IN VITRO BY HALOGENATED TAMOXIFEN ANALOGS**

The present example demonstrates the *in vitro* effect
5 of fluoro, cloro, bromo and iodo-alkyl halogenated
tamoxifen analogs on human breast tumor cell growth.
This *in vitro* test demonstrates also the utility of these
halogenated tamoxifen analogs for the *in vivo* treatment
of estrogen-dependent cancers, such as human breast and
10 uterine cancers. An additional object of this example
was to establish the utility of using the described
radiolabeled, alkyl halogenated tamoxifen derivatives as
imaging agents for imaging estrogen receptor positive
tumors *in vivo* and to demonstrate the applicability of
15 using the described alkyl halogenated tamoxifen analogs
as anti-cancer agents *in vivo*. It is anticipated that
the presently described halogenated tamoxifen analogs
will be useful in the treatment of estrogen-dependent
breast and uterine cancers, as well as other estrogen-
20 dependent cancer cell growths.

The aliphatically halogenated tamoxifen derivatives
described herein (Figure 1 and Examples 1-12) were used
together with an *in vitro* breast tumor cell system to
25 identify which of these agents might offer advantages
over other agents currently in use for the treatment and
diagnosis of estrogen receptive tumors.

The MCF7 cell line is a human tumor cell line. This
30 cell line was cultured in MEM (Eagles) media in a 5% CO₂
atmosphere with 10% fetal calf serum that had been washed
twice with dextran coated charcoal to reduce endogenous
estrogen levels. The media was supplemented with 1 mM
sodium pyruvate and 100 μ m non-essential amino acids.
35 The cell line was screened routinely for mycoplasma
contamination using the GenProbe kit (Fisher). Cells
were trypsinized and plated at a density of 5,000

cells/well in 96 well microtiter plates and allowed to attach and recover for 24 hours.

The media was removed by aspiration and replaced
5 with filter sterilized drug (concentration from 10^{-4} M to 10^{-5} M) in media. The cells were incubated for 72 hours and then stained using the MTT tetrazolium dye assay of Mosmann³⁶ except that after the media was removed, the blue formazan product was solubilized in 50 μ l/well DMSO.
10 Plates were shaken for 1 minute and read on a Dynatech MR600 microplate reader within an hour at a transmission wavelength of 570 nm and reference wavelength of 630 nm.

Compound III (N,N-diethylhydroxymethyltamoxifen), IV
15 (N,N-diethylfluorotamoxifen), VI (N,N-diethylfluoromethyltamoxifen), VII (fluorotamoxifen), X (N,N-diethyliodomethyltamoxifen), XI (N,N-diethylbromomethyltamoxifen), and XII (N,N-diethylchloromethyltamoxifen) were prepared substantially as
20 described in Examples 1-10.

The results of the 72 hour exposure of MCF7 tumor cell line to tamoxifen or analogs are summarized in Table
6. *cis* N,N-diethylfluoromethyltamoxifen was 3-fold more
25 potent than tamoxifen control against this tumor cell line. In addition, both *cis* N,N-diethyl-fluoro, fluoromethyl- and iodomethyl isomers appear to be more potent than the *trans* isomers.

30 These results demonstrate that the described fluorotamoxifen derivatives, particularly compounds IV (*cis*), VI (*cis* and *trans*) and X (*cis* and *trans*) are effective as inhibiting a breast tumor cell line, and further support the reasonable expectation that these
35 highly specific derivatives would be effective as an anti-cancer agent in treating human breast cancer.

In summary, this study demonstrates that halogenated tamoxifens with the halogen atom placed on the aliphatic chain bind to estrogen receptors *in vitro* and can be labeled with ^{18}F and ^{131}I , thus reflecting a utility for imaging estrogen receptors by PET and SPECT. Also, the data obtained from *in vitro* receptor assays suggested that the disclosed tamoxifen derivatives, particularly N,N-diethylfluoromethyltamoxifen and N,N-diethyliodomethyltamoxifen, may be potential ligands for mapping the estrogen receptor by PET and SPECT.

TABLE 7
EFFECT OF HALOGENATED TAMOXIFEN ANALOGS ON
HUMAN BREAST TUMOR CELL GROWTH *IN VITRO*¹

| Compound | IC ₅₀ Dose (μM) ² | RP ³ |
|---------------------------|--|-----------------|
| trans-tamoxifen (control) | 1.0 (14.6) | 100 |
| (III) OH (Cis) | 16.7 | 66 |
| (trans) | 22.0 | 50 |
| (IV) F (Cis) | 4.1 | 268 |
| (trans) | 13.4 | 82 |
| (VI) FM (Cis) | 4.5 | 244 |

| (trans) | 10.0 | 146 |

1. Cell line used was MCF7. Data represents average of three experiments.

2. IC₅₀ indicates the concentrations required to inhibit 50% of MCF₇ cells growth.

3. Relative potency (RP) indicates the IC₅₀ ratio between tamoxifen and competitor.

EXAMPLE 16

IN VIVO BIODISTRIBUTION IN RATS OF ADMINISTERED
5 N,N-DIETHYL-¹⁸F-FLUOROMETHYLTAMOXIFEN (VI)

10 The present example is presented to demonstrate the particular biodistribution characteristics of an alkyl halogenated tamoxifen derivative administered in an in vivo system.

Four groups of rats (150-200 gm, N = 4/group) were anesthetized with ketamine (10-15 mg/rat). Pure N,N-
15 diethyl-¹⁸F-fluoromethyltamoxifen (specific activity > 6 Ci/ μ mol) was reconstructed in 5% ethanol-saline solution, and 10 μ C of this tracer was given (i.v., tail-vein) into estrogen-primed female Sprague-Dawley rats ("primed" = 60
20 μ g estradiol, s.c., 3 days). Tissue uptake of ¹⁸F-tracer was determined at 2 and 4 hours (h). To ascertain whether the ¹⁸F-tracer uptake was mediated by a receptor-process, one group of rats was given ¹⁸F-tracer without priming with estradiol; and another group of rats was given unlabeled estradiol (30 μ g/rat) together with ¹⁸F-
25 tracer. The amount of unlabeled estradiol given to rats should occupy estrogen receptors and chase out the ¹⁸F-tracer's radioactivity from uterus.

TABLE 8
BIODISTRIBUTION OF N,N-DIETHYL-[^{18}F]FLUOROMETHYLTAMOXIFEN

5 % OF INJECTED DOSE/GRAM OF TISSUE WEIGHT OF RAT (N=4)
(PRIME WITH 60 μg OF ESTRADIOL FOR 3 DAYS)

| | 2h | 4h | 2h(BLOCK) ¹ | 2h* |
|----------------------|--------------------|--------------------|------------------------|--------------------|
| 10 BLOOD | 0.033 \pm 0.0059 | 0.045 \pm 0.0003 | 0.048 \pm 0.0066 | 0.033 \pm 0.0109 |
| LIVER | 4.540 \pm 0.5053 | 4.205 \pm 0.4397 | 4.451 \pm 1.1559 | 3.849 \pm 0.4069 |
| KIDNEY | 0.742 \pm 0.0756 | 0.796 \pm 0.0300 | 0.742 \pm 0.1451 | 0.530 \pm 0.0752 |
| UTERUS | 0.426 \pm 0.0177 | 0.400 \pm 0.0312 | 0.297 \pm 0.0356 | 0.248 \pm 0.0535 |
| MUSCLE | 0.151 \pm 0.0203 | 0.183 \pm 0.0015 | 0.145 \pm 0.0446 | 0.109 \pm 0.0218 |
| BONE | 0.653 \pm 0.1348 | 0.802 \pm 0.0556 | 0.576 \pm 0.1268 | 0.644 \pm 0.0656 |
| 15 INTES- TINE | 0.917 \pm 0.3058 | 1.101 \pm 0.5986 | 0.742 \pm 0.458 | 0.504 \pm 0.1784 |
| UTERUS/ BLOOD | 13.5 \pm 2.97 | 9.1 \pm 1.34 | 6.3 \pm 1.62 | 6.6 \pm 0.29 |
| 20 UTERUS/ MUSCLE | 2.9 \pm 0.43 | 2.2 \pm 0.16 | 2.2 \pm 0.62 | 2.5 \pm 0.37 |

1 Rats were coinjected with estradiol (30 μg) and F-18 tracer in the blocked group.

25 *Without prime with estradiol (control); rats weighted about 175 gm.

The uterus to blood ratio at 2 h in rats without priming with estradiol group was 6.6 \pm 0.29, which
30 changed to 13.5 \pm 2.97 in rats primed with estradiol.
This increased uptake was blocked by coinjection of estradiol and ^{18}F -tracer, where the ratio was 6.3 \pm 1.62.
The data suggest that the uterus uptake by ^{18}F -fluoro
analogue of tamoxifen is mediated by an estrogen receptor
35 process.

**PROPHETIC EXAMPLE 17 - PROPOSED HUMAN USE OF
ALKYL HALOGENATED TAMOXIFEN AND DERIVATIVES AS LIGANDS
LEGENDS FOR IMAGING ESTROGEN RECEPTOR POSITIVE TUMORS**

5 The present prophetic example is provided to outline
a procedure for the potential utility of the disclosed
tamoxifen analogs in imaging estrogen-receptor positive
tumor cells in humans. More specifically, the present
prophetic example is aimed at outlining a method by which
10 the described lower alkyl halo tamoxifen derivatives
molecules may be used to image estrogen receptor positive
tumors *in vivo*, most particularly those which typically
occur in breast tissue and uterine tissue.

15 In a most preferred embodiment of the proposed
method, the lower alkyl halotamoxifen derivative, *trans*-
N,N-diethylfluoromethyltamoxifen (compound VI), *trans*-
N,N-diethyl iodomethyltamoxifen (compound X), or
bromomethyltamoxifen are the radiopharmaceuticals of
20 choice to be used as the estrogen receptor imaging agent
in a standard PET (positron emission tomography) and
SPECT analysis. Of these, bromomethyltamoxifen produced
the most superior results in animal studies presented by
the Inventors.

25 The procedure for conducting estrogen receptor
mapping would be substantially the same as that outlined
by Minton et al.⁴ The most significant modification of
this procedure, among others, is that the estradiol-based
30 derivatives described by Minton would not be used, and
instead the aliphatic chain substituted tamoxifen
derivatives of the claimed invention would be used.

35 Briefly stated, the most preferred method for
imaging estrogen receptors in breast tumor tissue of a
patient, wherein a radiolabeled alkyl-halogenated
tamoxifen derivative (such as N,N-

diethyl[¹⁸F]fluoromethyltamoxifen, N,N-diethyl
[¹³¹I]iodomethyltamoxifen, N,N-diethylchloromethyltamoxifen
or N,N-diethylbromomethyltamoxifen) is employed as the
imaging agent, comprises the following steps:

5 administering to the patient a sufficient amount (about
10 mCi) of radiolabeled alkyl-halogenated tamoxifen
derivative to the breast tissue of the patient. The
patient is then to be placed in a supine position in the
PET device, at which time an emission scan of the chest
10 at the level of the breast mass is to be performed. The
technique for performing an emission scan of the chest is
well known to those of skill in the art, and the general
procedure for this technique is described by Mintun et
al.,⁴ which reference is specifically incorporated herein
15 for this purpose.

Most preferably, the emission consecutive transaxial
scan is to be performed for a 15 minute duration and most
preferably about 110 minutes after the injection of the
20 radiolabeled alkyl halogenated tamoxifen derivative.
Most preferably, the tumor location is to be confirmed by
palpation of the tissue after the patient is in the
described supine position. The $\mu\text{Ci/ml/pixel}$ of tumor
uptake will then be determined.

25 The PET images obtained are then to be evaluated for
the presence or absence of focally increased uptake of
the radiolabeled alkyl halogenated tamoxifen
fluorotamoxifen ligand in the breasts and in the axillae
30 as these were included in the field of view of the PET
scanner. Those sites determined from the PET images to
have demonstrated potential uptake are to be designated
as accordingly abnormal foci uptake of the radiolabeled
alkyl halogenated tamoxifen derivative.

35

The most preferred radiolabeled alkyl halogenated tamoxifen derivative to be used in the mapping and imaging of estrogen receptors in human tissue is N,N-diethylbromomethyltamoxifen.

5

**PROPHETIC EXAMPLE 18 - PROPOSED USE OF
ALKYL HALOGENATED TAMOXIFEN AND DERIVATIVES
IN TREATING CANCER**

10

The present prophetic example is provided to outline a procedure which could be employed for the potential utility of the described alkyl-halogenated tamoxifen derivatives in a treatment regimen for cancer in an animal.

15

While all of the aliphatic chain substituted tamoxifen derivatives described herein are expected to be useful in an animal treatment regimen, the lower alkyl halotamoxifen derivatives are most preferred. Among the lower alkyl halogen tamoxifen derivatives described herein, N,N-diethylfluoromethyltamoxifen is most particularly preferred.

The methods are postulated to be effective in the treatment of cancers which are estrogen-receptor positive, such as estrogen receptor positive breast cancers. The frequency and dosage amount of the disclosed tamoxifen derivatives would be optimized according to standard techniques, which are well known to those skilled in the art.

25

CLAIMS:

1. A tamoxifen derivative which is a compound of formula (1):

wherein R_1 is a halide lower halo-alkyl or a lower hydroxy alkyl; R_2 is a lower alkyl and R_3 is a lower alkyl.

2. The tamoxifen derivative of claim 1 wherein R_1 is halide defined as fluorine, iodine, bromine or chloride.

3. The tamoxifen derivative of claim 1 wherein R_1 is a lower halo-alkyl defined as fluoromethyl, iodomethyl, chloromethyl, or bromomethyl.

4. The tamoxifen derivative of claim 1 wherein R_1 is a lower hydroxy alkyl defined as hydroxymethyl.

5. The tamoxifen derivative of claim 1 wherein R_1 is fluoromethyl.

6. The tamoxifen derivative of claim 1 wherein R_1 is iodomethyl.

-57-

7. The tamoxifen derivative of claim 1 wherein R_1 is bromomethyl.

5 8. The tamoxifen derivative of claim 1 wherein R_1 is chloromethyl.

9. The tamoxifen derivative of claim 1 wherein R_2 and R_3
10 are methyl or ethyl and wherein R_2 is not methyl when R_3 is methyl.

10. The tamoxifen derivative of claim 1, 2, 3, 4 or 5
15 wherein R_2 and R_3 are ethyl.

11. The tamoxifen derivative of claim 5 or 6 having a
binding affinity for estrogen receptors of at least
20 thirty times greater than native tamoxifen.

12. A radiolabeled tamoxifen derivative which is a
compound of formula (2)

25

30

wherein 'X' is [18-F]fluoromethyl, or [131-I]iodomethyl,
[I-123]iodomethyl, [⁷⁵Br]bromomethyl or [⁷⁷Br]bromomethyl
or [Cl]chloromethyl; R_2 is methyl or ethyl; wherein R_3
is methyl or ethyl.

35

13. The radiolabeled tamoxifen derivative of claim 12 wherein R_2 is not methyl when R_3 is methyl.

14. The radiolabeled tamoxifen derivatives of claim 9 wherein R_2 is ethyl and R_3 is ethyl.

15. The radiolabeled tamoxifen derivative of claim 9 wherein X is [18-F]fluoromethyl or [131-I]iodomethyl.

16. The radiolabeled tamoxifen derivative of claim 9 wherein X is [18-F]fluoromethyl and R_2 and R_3 are ethyl.

17. The radiolabeled tamoxifen derivative of claim 9 wherein X is [^{75}Br]bromomethyl or [^{77}Br]bromomethyl.

18. The radiolabeled tamoxifen derivative of claim 9 wherein X is [^{75}Br]bromomethyl or [^{77}Br]bromomethyl and R_2 and R_3 are ethyl.

19. A method for inhibiting an estrogen-receptor positive tumor in a patient comprising administering to the patient a tumor-inhibiting tamoxifen derivative which is a compound of formula 1

wherein R_1 is a halide, a lower halo-alkyl or a lower hydroxy alkyl; R_2 is a lower alkyl; and R_3 is a lower alkyl.

5

20. The method of claim 19 wherein the tamoxifen derivative is further defined wherein R_1 is a halogen; R_2 is methyl or ethyl; R_3 is methyl or ethyl and wherein R_2 is not methyl when R_3 is methyl.

10

21. The method of claim 19 wherein the tamoxifen derivative is further defined wherein R_1 is the halogen bromine, chlorine, fluorine or iodine.

15

22. The method of claim 19 wherein the tamoxifen derivative is further defined wherein R_1 is the halogen fluorine, R_2 is the lower alkyl ethyl, and R_3 is the lower alkyl ethyl.

20

23. A radiopharmaceutical having binding affinity for estrogen receptors comprising a radiolabeled tamoxifen derivative, wherein the radiolabel comprises ^{18}F , ^{131}I , or ^{77}Br and wherein the tamoxifen derivative is substituted at an alkyl side chain of the tamoxifen molecule.

25

30 24. The radiopharmaceutical of claim 23, wherein the alkyl side chain comprises a chain of at least two carbons.

25. The radiopharmaceutical of claim 23, defined as comprising an ^{18}F radiolabel and as comprising ^{18}F -N,N-diethylfluoromethyltamoxifen or ^{18}F -fluoromethyltamoxifen.
- 5 26. The radiopharmaceutical of claim 23, which is iodomethyltamoxifen comprising an ^{131}I radiolabel.
- 10 27. The estrogen receptor radiopharmaceutical agent of claim 23, which is bromomethyl tamoxifen comprising a ^{77}Br radiolabel.
- 15 28. The estrogen receptor radiopharmaceutical agent of claim 22 defined as N,N-dimethylchloromethyltamoxifen.
- 20 29. A method for preparing a radiolabeled lower halo-alkyl tamoxifen derivative comprising the steps of:
- dissolving a quantity of clomiphene in a sufficient volume of tetrahydrofuran to form a reaction mixture;
- 25 adding t-butyl lithium and trimethyl oxide to the reaction mixture to form a second reaction mixture;
- 30 extracting the second reaction mixture with ether and collecting an ether layer containing N,N-diethyl hydroxymethyltamoxifen;
- 35 isolating the N,N-diethyl hydroxymethyltamoxifen from the ether layer;

dissolving the N,N-diethyl hydroxymethyltamoxifen in methylene chloride and adding thereto pyridine and tosyl chloride to form a third reaction mixture;

5

diluting the third reaction mixture with methylene chloride and isolating a methylene chloride layer containing a tosyl analog of tamoxifen;

10

isolating the tosyl analog of tamoxifen from the methylene chloride layer;

displacing the tosyl with Na¹⁸F or Na¹³¹I to produce a radiolabeled alkyl halogenated tamoxifen derivative.

15

30. The alkyl method of claim 29 wherein the radiolabeled lower halo-alkyl tamoxifen derivative is ¹⁸F-fluoromethyltamoxifen.

20

31. The method of claim 29 wherein the tosyl group is displaced with Na¹³¹I and the radiolabeled lower halo-alkyl tamoxifen derivative is ¹³¹I-iodomethyltamoxifen.

25

32. The method of claim 29 wherein the radiolabeled lower-alkyl tamoxifen derivative is ¹⁸F-N,N-diethylfluorotamoxifen, ¹⁸F-N,N-diethylfluoromethyltamoxifen, or ¹³¹I-N,N-diethyliodomethyltamoxifen.

30

33. The method of claim 29 wherein the radiolabeled tamoxifen derivative is [¹⁸-F]N,N-diethylfluoromethyltamoxifen.

35

34. The method of claim 29 wherein the tosyl analog of tamoxifen is N,N-diethyl-O-tosyltamoxifen or N,N-dimethyl-O-tosyltamoxifen.

5

35. The method of claim 29 wherein the radiolabeled alkyl halogenated tamoxifen derivative is N,N-diethyltamoxifen.

10

36. The method of claim 29, wherein the lower halo-alkyl tamoxifen derivative is a cis isomer of a methyl halotamoxifen derivative.

15

37. A method for preparing an alkyl halogenated methyl tamoxifen derivative comprising the steps of:

20 dissolving a quantity of clomiphene in a volume of t-butyl;

forming a mixture containing N,N-dimethylhydroxymethyl tamoxifen;

25

isolating the N,N-dimethylhydroxymethyltamoxifen in methylene chloride and adding thereto pyridine and tosyl chloride;

30 diluting the mixture with methylene chloride and isolating a methylene chloride layer containing a tosyl analog of tamoxifen;

isolating the tosyl analog of tamoxifen;

35

adding tetrabutylammonium fluoride or sodium iodide to form a mixture comprising a fluoride or iodide labeled N,N-diethylhydroxymethyl-tamoxifen; and

5

isolating the alkyl halogenated methyl tamoxifen derivative.

10

38. A method for imaging estrogen receptors in an estrogen receptor-rich tissue of a patient comprising labeling the estrogen receptor with a radiolabeled halo tamoxifen derivative comprising the steps of:

15

administering a sufficient quantity of the radiolabeled lower alkyl-halo tamoxifen derivative to an estrogen receptor rich tissue of the patient;

20

positioning the patient spine in a PET device;

performing an emission scan of the estrogen-receptor rich tissue, and obtaining a PET image of the tissue; and

25

evaluating the PET image for the presence or absence of focally increased uptake of the radiolabel in the tissue.

30

39. The method of claim 41 wherein the radiolabeled alkyl halogenated tamoxifen derivative is trans-[18-F]fluoromethyl-diethyltamoxifen.

35

40. The method of claim 38 wherein the radiolabeled halotamoxifen derivative is [¹³¹I]iodomethyl N,N-diethyltamoxifen.
- 5 41. The method of claim 38 wherein the radiolabeled halotamoxifen derivative is [⁷⁷Br]bromomethyl N,N-diethyltamoxifen.
- 10 42. The method of claim 38 wherein the alkyl halotamoxifen derivative is [¹³¹I]iodomethyltamoxifen.
- 15 43. The method of claim 38 wherein the alkyl halotamoxifen derivative is chloromethyltamoxifen.
- 20 44. The method of claim 38 wherein the radiolabeled alkyl halogenated tamoxifen derivative is [⁷⁷Br]bromomethyltamoxifen.
- 25 45. The method of claim 38 wherein the estrogen receptor-rich tissue is breast tissue.
- 30 46. The method of claim 38 wherein the emission scan is performed for between about 15 minutes following administration of the alkyl-halogenated tamoxifen derivative.
- 35 47. The method of claim 38 wherein the emission scan is performed about 110 minutes after the administration of the alkyl-halogenated tamoxifen derivative.

48. A pharmaceutical agent for the radiotherapy of a
estrogen hormone dependent tumor comprising a
radiolabeled alkyl halotamoxifen derivative, wherein said
radiolabeled alkyl halotamoxifen derivative is:
5 $[^{18}\text{F}]$ fluoromethyl N,N-diethyl-tamoxifen, $[^{131}\text{I}]$ iodomethyl
or $[^{77}\text{Br}]$ bromomethyl N,N-diethyl tamoxifen.

49. The pharmaceutical agent of claim 48 wherein the
10 radiolabeled alkyl halotamoxifen derivative is
 $[^{77}\text{Br}]$ bromoethyl N,N-diethyltamoxifen.

50. The pharmaceutical agent of claim 48 wherein the
15 radiolabeled alkyl halotamoxifen derivative is
 $[^{18}\text{F}]$ fluoromethyl-N,N-diethyltamoxifen.

AMENDED CLAIMS

[received by the International Bureau
on 24 March 1992 (24.03.92);
original claims 1-50 replaced by amended
claims 1-47 (9 pages)]

1. A tamoxifen derivative which is a compound of
formula (1):

wherein R_1 is a halide lower halo-alkyl or a lower hydroxy
alkyl.

15

2. The tamoxifen derivative of claim 1 wherein R_1 is
halide defined as fluorine, iodine, bromine or chloride.

20

3. The tamoxifen derivative of claim 1 wherein R_1 is a
lower halo-alkyl defined as fluoromethyl, iodomethyl,
chloromethyl, or bromomethyl.

25

4. The tamoxifen derivative of claim 1 wherein R_1 is a
lower hydroxy alkyl defined as hydroxymethyl.

30

5. The tamoxifen derivative of claim 1 wherein R_1 is
fluoromethyl.

6. The tamoxifen derivative of claim 1 wherein R_1 is iodomethyl.

5 7. The tamoxifen derivative of claim 1 wherein R_1 is bromomethyl.

8. The tamoxifen derivative of claim 1 wherein R_1 is
10 chloromethyl.

9. The tamoxifen derivative of claim 5 or 6 having a
binding affinity for estrogen receptors of at least
15 thirty times greater than native tamoxifen.

10. A radiolabeled tamoxifen derivative which is a
compound of formula (2)

20

25

wherein 'X' is [18-F]fluoromethyl, or [131-I]iodomethyl,
[I-123]iodomethyl, [⁷⁵Br]bromomethyl or [⁷⁷Br]bromomethyl
or [Cl]chloromethyl; R_2 is methyl or ethyl; wherein R_3
is methyl or ethyl.

30

11. The radiolabeled tamoxifen derivative of claim 10
wherein R_2 is not methyl when R_3 is methyl.

35

12. The radiolabeled tamoxifen derivative of claim 10

wherein X is [18-F]fluoromethyl or [131-I]iodomethyl.

13. The radiolabeled tamoxifen derivative of claim 10
5 wherein X is [18-F]fluoromethyl.

14. The radiolabeled tamoxifen derivative of claim 10
10 wherein X is [⁷⁵Br]bromomethyl or [⁷⁷Br]bromomethyl.

15. The radiolabeled tamoxifen derivative of claim 10
wherein X is [⁷⁵Br]bromomethyl or [⁷⁷Br]bromomethyl.

16. A method for inhibiting an estrogen-receptor
positive tumor in a patient comprising administering to
the patient a tumor-inhibiting tamoxifen derivative which
is a compound of formula 1

wherein R₁ is a halide, a halogen, a lower halo-alkyl or a
lower hydroxy alkyl.

17. The method of claim 16 wherein the tamoxifen
30 derivative is further defined wherein R₁ is a halogen.

18. The method of claim 16 wherein the tamoxifen
35 derivative is further defined wherein R₁ is the halogen

- 69 -

bromine, chlorine, fluorine or iodine.

19. The method of claim 16 wherein the tamoxifen
5 derivative is further defined wherein R₁ is the halogen
fluorine.
20. A radiopharmaceutical having binding affinity for
10 estrogen receptors comprising a radiolabeled tamoxifen
derivative, wherein the radiolabel comprises ¹⁸F, ¹³¹I, or
⁷⁷Br and wherein the tamoxifen derivative is substituted
at an alkyl side chain of the tamoxifen molecule.
- 15 21. The radiopharmaceutical of claim 20, wherein the
alkyl side chain comprises a chain of at least two
carbons.
- 20 22. The radiopharmaceutical of claim 20, defined as
comprising an ¹⁸F radiolabel and as comprising ¹⁸F-N,N-
diethylfluoromethyltamoxifen or ¹⁸F-fluoromethyltamoxifen.
- 25 23. The radiopharmaceutical of claim 20, which is
iodomethyltamoxifen comprising an ¹³¹I radiolabel.
- 30 24. The estrogen receptor radiopharmaceutical agent of
claim 20, which is bromomethyl tamoxifen comprising a ⁷⁷Br
radiolabel.
- 35 25. The estrogen receptor radiopharmaceutical agent of
claim 20 defined as N,N-dimethylchloromethyltamoxifen.

26. A method for preparing a radiolabeled lower halo-alkyl tamoxifen derivative comprising the steps of:

- 5 dissolving a quantity of clomiphene in a sufficient volume of tetrahydrofuran to form a reaction mixture;
- adding t-butyl lithium and trimethyl oxide to the
- 10 reaction mixture to form a second reaction mixture;
- extracting the second reaction mixture with ether and collecting an ether layer containing N,N-
- 15 diethyl hydroxymethyltamoxifen;
- isolating the N,N-diethyl hydroxymethyltamoxifen from the ether layer;
- 20 dissolving the N,N-diethyl hydroxymethyltamoxifen in methylene chloride and adding thereto pyridine and tosyl chloride to form a third reaction mixture;
- 25 diluting the third reaction mixture with methylene chloride and isolating a methylene chloride layer containing a tosyl analog of tamoxifen;
- isolating the tosyl analog of tamoxifen from the
- 30 methylene chloride layer;
- displacing the tosyl with Na¹⁸F or Na¹³¹I to produce a radiolabeled alkyl halogenated tamoxifen derivative.

35

- 71 -

27. The alkyl method of claim 26 wherein the radiolabeled lower halo-alkyl tamoxifen derivative is ^{18}F -fluoromethyltamoxifen.

5

28. The method of claim 26 wherein the tosyl group is displaced with Na^{131}I and the radiolabeled lower halo-alkyl tamoxifen derivative is ^{131}I -iodomethyltamoxifen.

10

29. The method of claim 26 wherein the radiolabeled lower-alkyl tamoxifen derivative is ^{18}F -N,N-diethylfluorotamoxifen, ^{18}F -N,N-diethylfluoromethyltamoxifen, or ^{131}I -N,N-diethyliodomethyltamoxifen.

15

30. The method of claim 26 wherein the radiolabeled tamoxifen derivative is ^{18}F -N,N-diethylfluoromethyltamoxifen.

20

31. The method of claim 26 wherein the tosyl analog of tamoxifen is N,N-diethyl-O-tosyltamoxifen or N,N-dimethyl-O-tosyltamoxifen.

25

32. The method of claim 26 wherein the radiolabeled alkyl halogenated tamoxifen derivative is N,N-diethyltamoxifen.

30

33. The method of claim 26, wherein the lower halo-alkyl tamoxifen derivative is a *cis* isomer of a methyl halotamoxifen derivative.

35

- 72 -

34. A method for preparing an alkyl halogenated methyl tamoxifen derivative comprising the steps of:

- 5 dissolving a quantity of clomiphene in a volume of
 t-butyl;
- forming a mixture containing N,N-
 dimethylhydroxymethyl tamoxifen;
- 10 isolating the N,N-dimethylhydroxymethyltamoxifen in
 methylene chloride and adding thereto pyridine
 and tosyl chloride;
- diluting the mixture with methylene chloride and
15 isolating a methylene chloride layer containing
 a tosyl analog of tamoxifen;
- isolating the tosyl analog of tamoxifen;
- 20 adding tetrabutylammonium fluoride or sodium iodide
 to form a mixture comprising a fluoride or
 iodide labeled N,N-diethylhydroxymethyl-
 tamoxifen; and
- 25 isolating the alkyl halogenated methyl tamoxifen
 derivative.

35. A method for imaging estrogen receptors in an
30 estrogen receptor-rich tissue of a patient comprising
 labeling the estrogen receptor with a radiolabeled halo
 tamoxifen derivative comprising the steps of:

- 35 administering a sufficient quantity of the
 radiolabeled lower alkyl-halo tamoxifen
 derivative to an estrogen receptor rich tissue

of the patient;

positioning the patient spine in a PET device;

5 performing an emission scan of the estrogen-receptor
rich tissue, and obtaining a PET image of the
tissue; and

10 evaluating the PET image for the presence or absence
of focally increased uptake of the radiolabel in
the tissue.

36. The method of claim 35 wherein the radiolabeled
15 alkyl halogenated tamoxifen derivative is trans-[18-
F]fluoromethyl-diethyltamoxifen.

37. The method of claim 35 wherein the radiolabeled
20 halotamoxifen derivative is [131-I]iodomethyl
N,N-diethyltamoxifen.

38. The method of claim 35 wherein the radiolabeled
halotamoxifen derivative is [⁷⁷Br]bromomethyl
25 N,N-diethyltamoxifen.

39. The method of claim 35 wherein the alkyl
halotamoxifen derivative is [¹³¹I]iodomethyltamoxifen.
30

40. The method of claim 35 wherein the alkyl
halotamoxifen derivative is chloromethyltamoxifen.

35 41. The method of claim 35 wherein the radiolabeled

alkyl halogenated tamoxifen derivative is
[⁷⁷Br]bromomethyltamoxifen.

5 42. The method of claim 35 wherein the estrogen
receptor-rich tissue is breast tissue.

43. The method of claim 35 wherein the emission scan is
10 performed for between about 15 minutes following
administration of the alkyl-halogenated tamoxifen
derivative.

15 44. The method of claim 35 wherein the emission scan is
performed about 110 minutes after the administration of
the alkyl-halogenated tamoxifen derivative.

20 45. A pharmaceutical agent for the radiotherapy of a
estrogen hormone dependent tumor comprising a
radiolabeled alkyl halotamoxifen derivative, wherein said
radiolabeled alkyl halotamoxifen derivative is:
[¹⁸F]fluoromethyl N,N-diethyl-tamoxifen, [¹³¹I]iodomethyl
25 or [⁷⁷Br]bromomethyl N,N-diethyl tamoxifen.

46. The pharmaceutical agent of claim 45 wherein the
radiolabeled alkyl halotamoxifen derivative is
30 [⁷⁷Br]bromoethyl N,N-diethyltamoxifen.

47. The pharmaceutical agent of claim 45 wherein the
radiolabeled alkyl halotamoxifen derivative is
15 [¹⁸]fluoromethyl-N,N-diethyltamoxifen.

STATEMENT UNDER ARTICLE 19.

Claim 1 has been amended to define a chemical structure which includes an N,N diethyl amino group and a carbon alkyl chain of 2 carbon atom length, which includes a halogen at the terminal end thereof. The amendments to claim 1 result in a specific chemical structure which is new in light of the chemical structures defined in the cited Toivola et al. patent.

The specific chemical structure of claim 1 is also distinguished over those structures defined in Foster et al., as Foster et al. relates to hydroxy derivatives of tamoxifen and the claimed derivative is not a hydroxy derivative.

The Watanabe et al. article discloses human metabolites of toremifene, which include an N,N dimethyl amino structure, an N-demethyl toremifene structure, a 4-hydroxy toremifene structure, an N-demethyl-4-hydroxy toremifene structure and a 4,4'-d, hydroxy toremifene structure. No N,N diethyl amino derivatives of tamoxifen are disclosed, and therefore the claimed derivative of tamoxifen is novel.

The D'Argy et al. abstract (1989) describes a [³H] toremifene, particularly in regard to its tissue distribution. Toremifene has an N,N-dimethyl ethyl amine citrate chemical structure. In contrast, the claimed tamoxifen derivative structure includes an N,N-diethyl amino structure. The claimed derivatives are thus novel over the chemical structures of D'Argy.

The Kangas et al. abstract (1989) again relates to a toremifene structure, and the biodistribution of radiolabeled toremifene in tissues and tumors. These derivatives were described as having limited use in diagnosing and imaging

- 76 -

estrogen receptor-rich breast tumors in humans. Again, the toremifene structure includes an N,N-dimethyl ethylamine citrate chemical structure, while the claimed derivatives have an N,N-diethyl amino group.

Former claim 19 (now claim 16) has also been amended to include an N,N-diethyl amino structure. The chemical structure of this derivative is novel compared to the N,N-dimethyl amino and toremifene derivatives of Toivola et al., Foster et al., Watanabe, D'Argy and Kangas et al. for the reasons afore-described. The radiolabeled derivatives provide surprising efficacy for use as radiodiagnostic agents as they have an enhanced target tissue specificity for estrogen-rich tissues. Moreover, the claimed derivative structure has an enhanced receptor binding affinity and potency by virtue of its N,N-diethyl structure, as the absence of halogen at the phenolic ring preserves the conformational activity of the derivative for attachment to estrogen receptors, as well as rendering the molecule less susceptible to halogen elimination.

Attached are replacement pages 56-65 with the amended claims and abstract. Former claim 12 is now claim 10. Formerly numbered claims 11-50 are now claims 9-47.

FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V. ☒ OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE ¹

This International search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim numbers
Authority, namely: because they relate to subject matter not required to be searched by this

Although claims 19-22 and 38-47 are directed to a method of treatment of the human or animal body as well as a diagnostic method the search has been carried out and based on the alleged effects of the compound.

2. ☐ Claim numbers
because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claim numbers
the second and third sentences of PCT Rule 6.4(a), because they are dependent claims and are not drafted in accordance with

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²

This International Searching Authority found multiple inventions in this International application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the International application
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
☐ No protest accompanied the payment of additional search fees.

ANNEX TO THE INTERNATIONAL SEARCH REPORT
ON INTERNATIONAL PATENT APPLICATION NO.

US 9107150
SA 53097

This annex lists the patent family members relating to the patent documents cited in the above-mentioned international search report. The members are as contained in the European Patent Office EDP file on 24/02/92. The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
